dedicated to the HERMIONE project

Table S1. Pairwise comparisons illustrating differences in biopolymeric and bioavailable C sedimentary concentrations and values of the bioavailable fraction of biopolymeric C between the DSWC impacted sediments (April 2005) vs. all other sampling periods in the Cap de Creus canyon (ca. 1000 and ca. 1800 m depth) and deep margin (>2100m depth). Grey lines indicate contrasts including DSWC. Bold numbers indicate significant contrasts ($\alpha=0.05$).

	Aug 05	0	3	0	0	-	3	0
	Apr 09	0	0	0	3	-	3	100
	Total correct						6/12	50
	Mis-classification error (%)							50
Trace statistic = $(\text{tr}(Q_m'HQ_m)) = 1.9801 \ (P=0.0004)$								
First squared canonical correlation = $(\delta_1^2) = 0.99829 \ (P=0.0022)$								

Table S4. Results of the SIMPER analysis illustrating species contributing cumulatively >50% to the dissimilarity among nematode assemblages during the 2005 cascading event (Apr 05) and all other sampling periods. Results are presented for the three different depth ranges (ca. 1000m and ca. 1800 m depth in the canyon and >2100 m in the deep margin). Species in red are those observed in sediments exposed to the 2005 cascading event but absent in samples collected after the event .

Contrast	Depth	Species	April 2005 Abundance	October 2005 Abundance	Contribution to dissimilarity (%)	Cumulative dissimilarity (%)
Apr 05 vs. Oct 05	1000 m	<i>Amphimonhystralla sp1</i>	0	1	1.94	1.94
