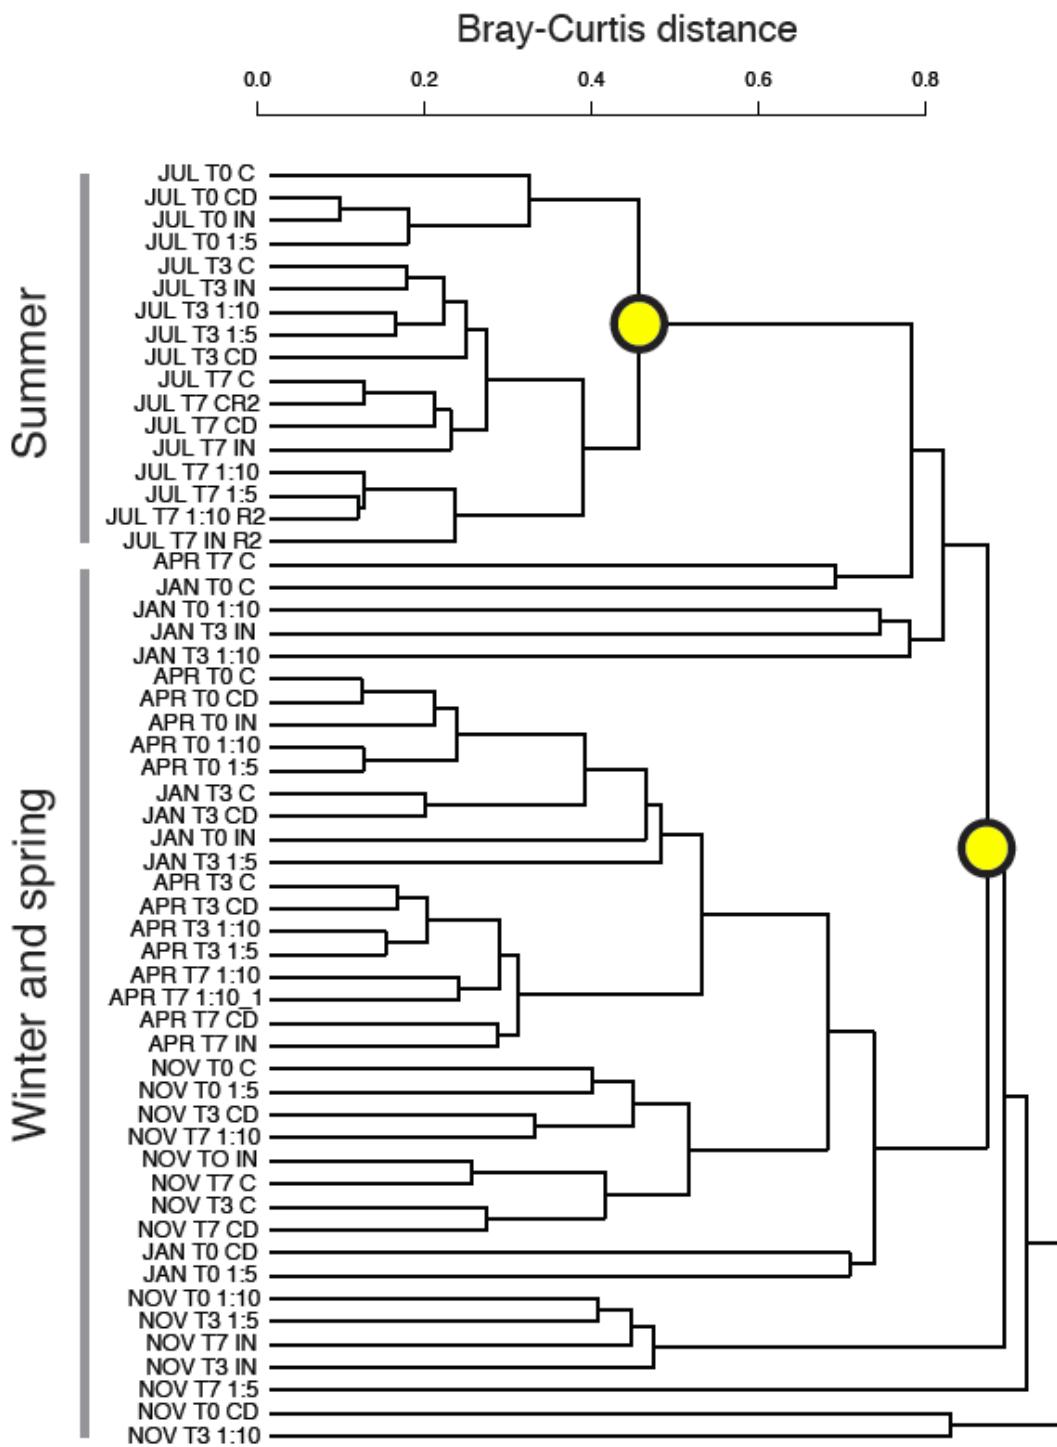

Figure S1. Dendrogram showing a comparison of beta-diversity between samples taken from the experiments performed in January, April, July, November and December. Dissimilarity corresponds to Bray-Curtis distance estimation using 97% 16S rRNA sequence similarity. Yellow circle denote a distinct visual clustering between summer experiments and winter and spring experiments.

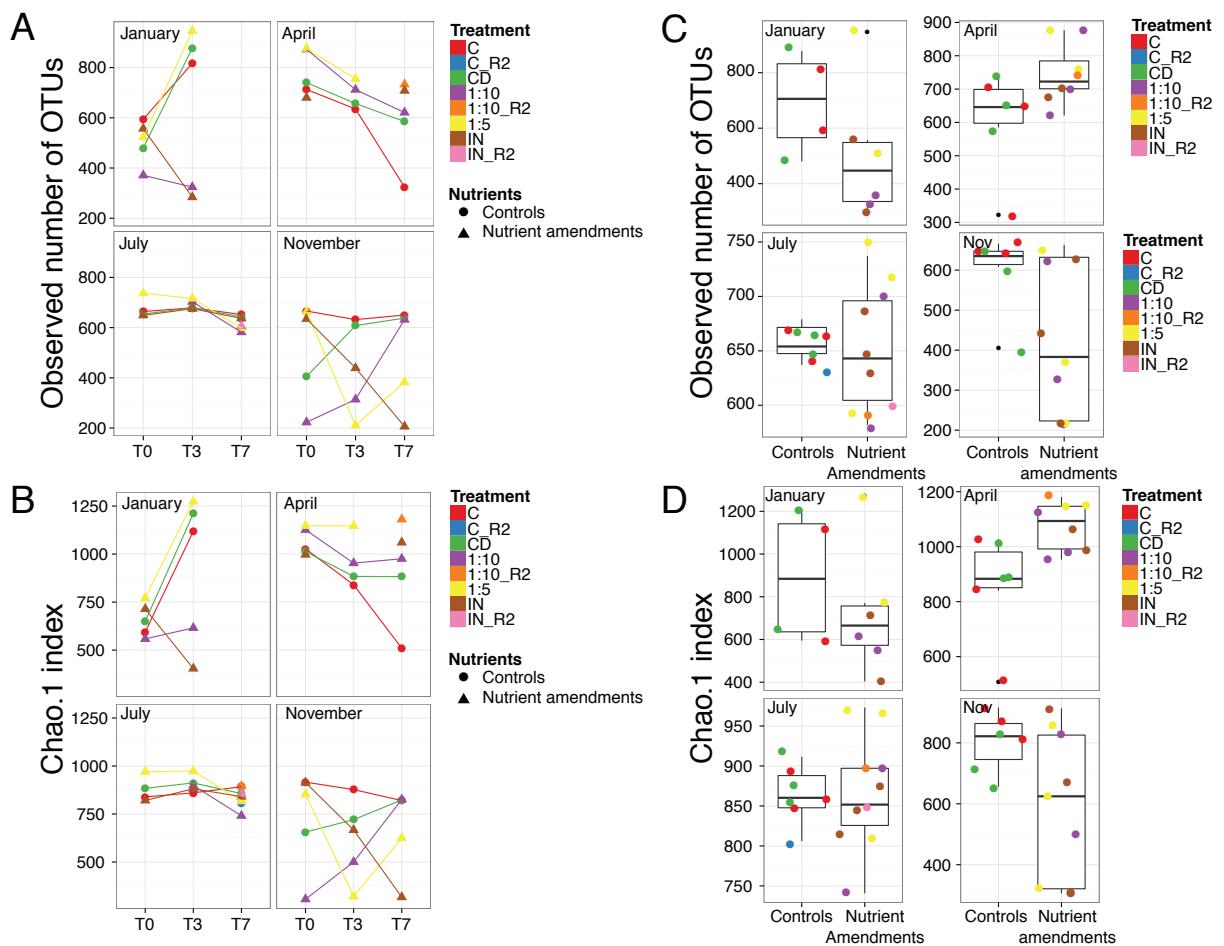

Figure S2. Variation in observed number of OTUs (A) and Chao.1 richness index (B) for the different experiments.

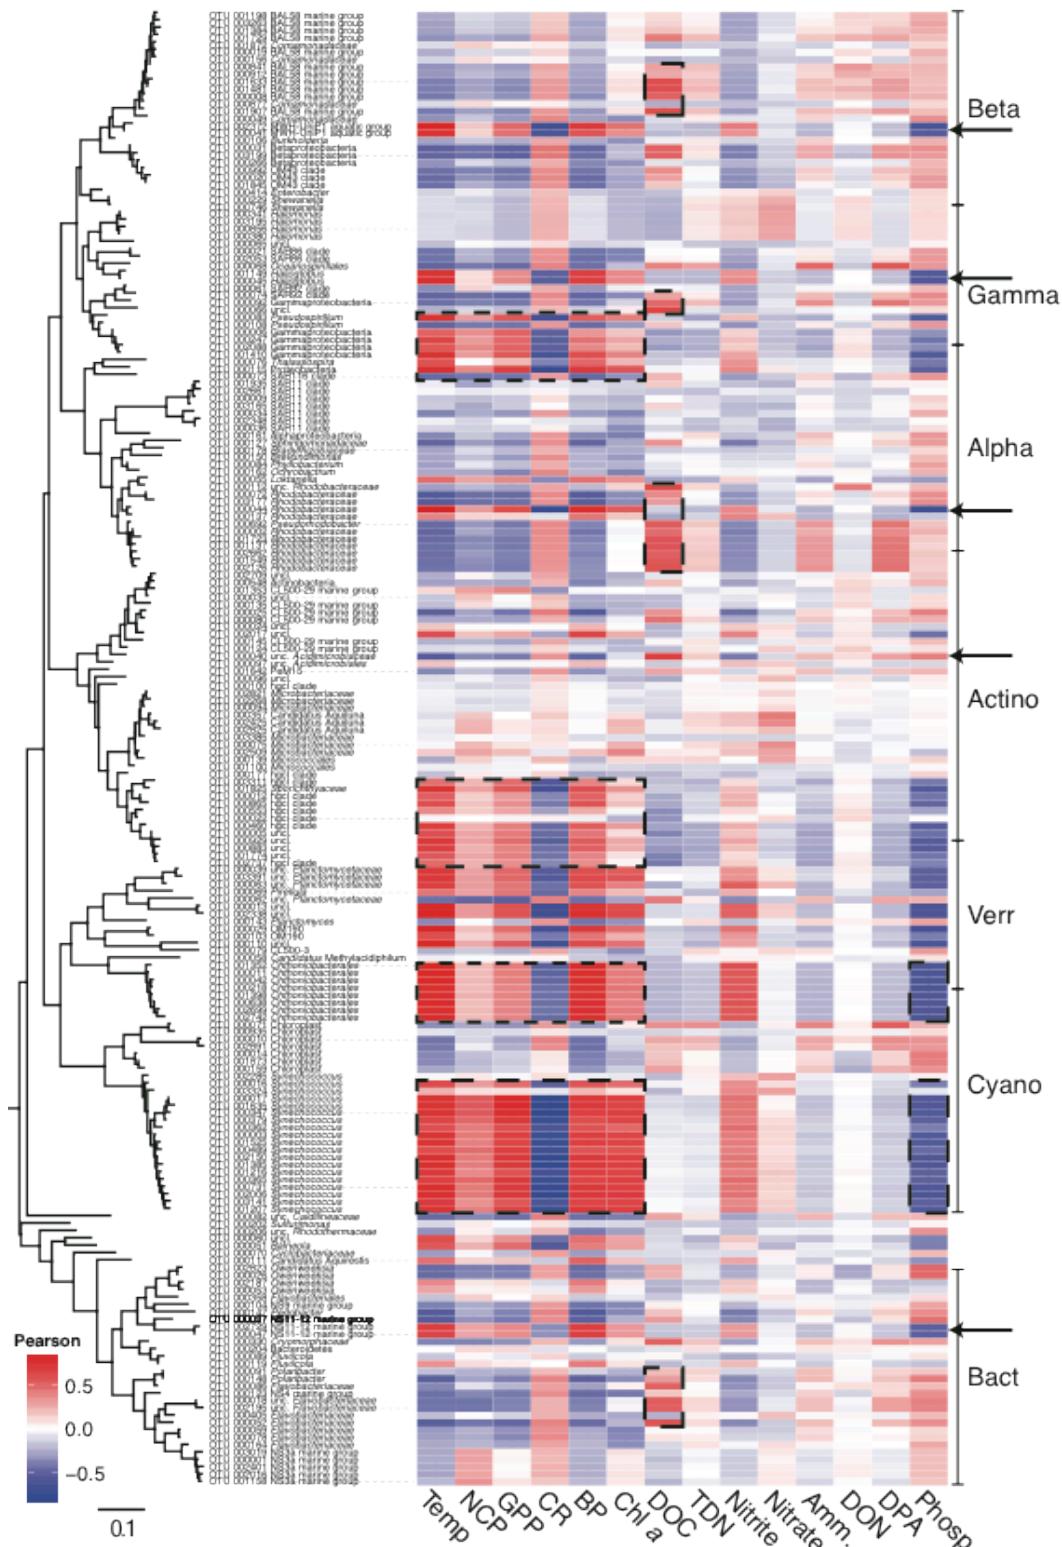

Figure S3. Correlations between shifts in relative abundances of specific individual OTUs and environmental factors and metabolic activity.

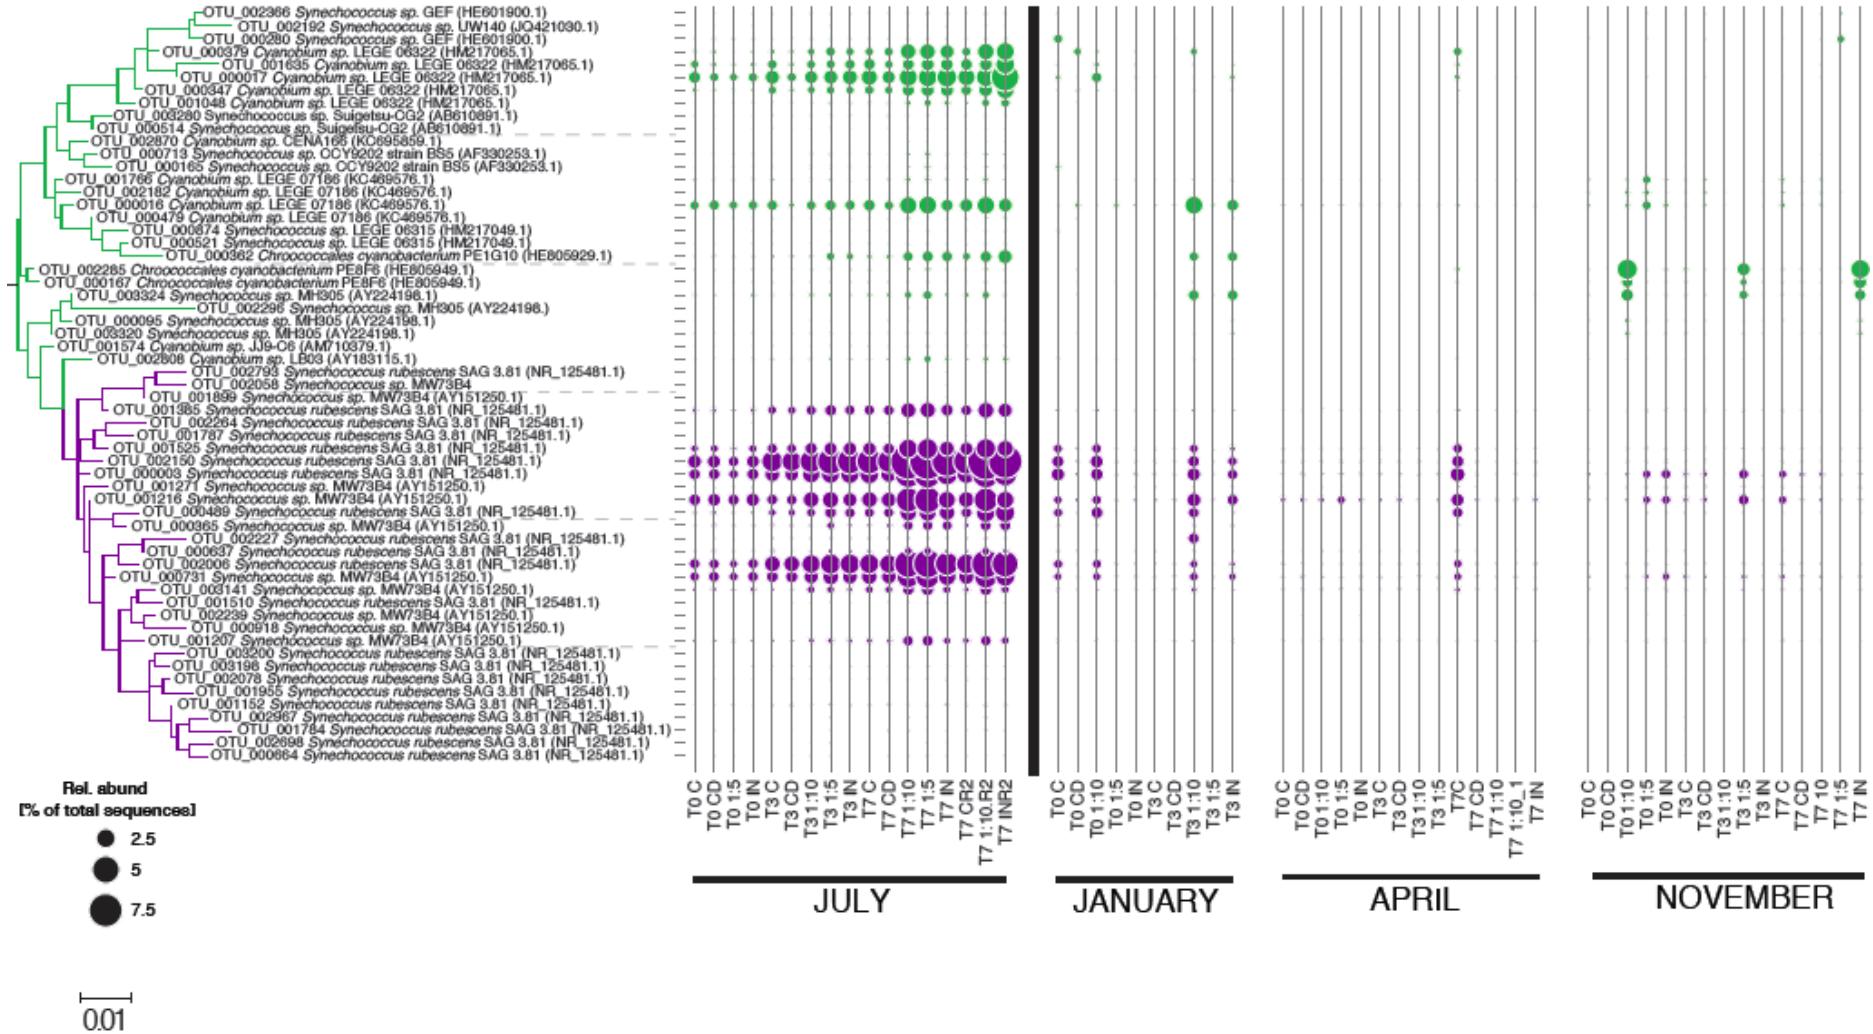

Figure S4. Maximum-likelihood tree of 16S rRNA sequences affiliated with Synechococcus obtained from Illumina MiSeq-sequencing. Bubble diagram indicate relative abundances (percent of total sequences) in the different treatments and experiments for the 60 most abundant Synechococcus OTUs.
