

Supplement of

Catchment tracers reveal discharge, recharge and sources of groundwater-borne pollutants in a novel lake modelling approach

Figure S1: Weekly CDOM absorption ($A_{\text{CDOM}}(340) \text{ cm}^{-1}$) and DOC (mg C l^{-1}) measurements from a drainage channel in the catchment area and precipitation (mm) data from a weather station placed at the lake shore. Data are shown as the running average of four weeks.

5 **Figure S2:** Bar plot showing the results from the sensitivity analysis derived from the CATS model. The top x-axis shows the different concentrations used for the lake e.g. no change (Lake), 10 % reduction (Lake -10 %) and 10 % increment (Lake +10). The left y-axis denotes the estimated fractions of inflowing groundwater originating from the groundwater well sites (bottom x-axis, only sites delivering more than 0.01 are shown) and the second y-axis denotes the corresponding WRT. In general, a smaller variance between sites and discharge fractions is seen up to a WRT of 1.25 years. Above this point there is some changes between site 11 and 13. Overall, the same 5 groundwater well sites are isolated which explain the measured lake concentrations.

Table S1: Tracer concentrations of $\delta^{18}\text{O}$ (‰), dissolved organic carbon (DOC $\mu\text{mol l}^{-1}$), coloured dissolved organic matter (ACDOM(340) cm^{-1}), total dissolved phosphorus (TDP $\mu\text{g l}^{-1}$), total phosphorus (TP $\mu\text{g l}^{-1}$), total dissolved nitrate (TDN $\mu\text{g l}^{-1}$), total nitrate (TN $\mu\text{g l}^{-1}$) and maximum fluorescence of component C1-C5 in Raman's units (R.U.) found around the lake (1-30), in the lake (a, b and c) and at a water locked (WL) site. Dissolved nutrients are measured in groundwater while total fractions are found in lake water. For site reference see figure 1a.

Sites	$\delta^{18}\text{O}$ ‰	DOC $\mu\text{mol l}^{-1}$	CDOM ACDOM(340) cm^{-1}	TDP/T P $\mu\text{g l}^{-1}$	TDN/T N $\mu\text{g l}^{-1}$	C1 R.U.	C2 R.U.	C3 R.U.	C4 R.U.	C5 R.U.
