Supplementary material 1: Analyses of the concentrations of macro-nutrients (nitrate, NO_3 ; nitrite, NO_2 ; and silicic acid, Si(OH)_4), biogenic silica (BSi), and particulate organic carbon and nitrogen (POC and PON).

1. Sampling:

The GEOVIDE cruise was conducted in May-June 2014 and consisted in 78 stations. Stations were labeled as Short (46), Large (17), XLarge (5), and Super (10) stations depending on the number of parameters and rosette casts. The first station cast was used as reference for physicochemical characterization of water masses. During the first cast at each station, a standard stainless steel rosette (SSSR) equipped with 22 Niskin bottles and a CTD (SBE911 and SBE9+) equipped with a SBE-43 was deployed.

For the analyses of macro-nutrients, samples were taken in all the 78 stations from the SSSR. For BSi and POC/PON measurements, samples were collected from the SSSR at all Large, XLarge and Super stations.

2 Analytical procedures

2.1. Macro-nutrients

2.1.1. Apparatus and analysis protocols

Analyses for nitrite and nitrate concentrations were conducted on unfiltered samples directly aboard the R.V. Pourquoi Pas?. Unfiltered samples were stored in 15 mL plastic tubes at +5°C, for analyses of silicic acid concentrations at the LEMAR laboratory.

For the measurements of the macro-nutrients concentrations in the GEOVIDE samples, a SEAL AutoAnalyzer II continuous flow analyzer (CFA) were used aboard the R.V. *Pourquoi Pas?*, and a SEAL AutoAnalyzer III at the LEMAR laboratory in Brest, following the protocols described by Aminot & Kerouel (2007) and using very high purity reagents. Deionized ("Millipore") water was run through the CFA to determine the optical base line of the CFA for the determination of nitrite, nitrate, and silicic acid concentration.

Typically, the analysis of the samples of a given station was performed successively, running through the CFA: (i) a set of subsamples of standard solutions (cf. 2.1.2.), (ii) duplicates of samples of the station, and (iii) a set of subsamples of standard solutions and then 5- to correct from CFA refraction signal, all the samples were then re-run through the CFA channels, according to Aminot and Kerouel (2007).

For the GEOVIDE cruise, the repeatability between samples was better than 0.003 μM for nitrite, better than 0.02 μM for nitrate, and better than 0.02 μM for silicic acid.

2.1.2. Calibration procedures

According to Aminot and Kerouel (2007) artificial seawater was used for the preparation of calibration standards. All the volumetric glass- and plastic ware used were gravimetrically calibrated at the temperature of the laboratory (about 20°C). All volumetric flasks used were Class A+. All pipets used have a nominal calibration tolerance of 0.1% or better.

Eight seawater standards were made for each parameters: For nitrite, between 0 and 2 μM ; for nitrate, between 0 and 25 μM ; and for silicic acid between 0 and 60 μM for deep stations and between 0 and 25 μM for shallow stations.

Calibration equations was strictly linear for nitrite and nitrate. Calibration was second order polynomial for silicic acid in the 0-60 μM range.

2.1.3. Certification of the measurements

To certify the GEOVIDE primary standard solutions of nitrite, nitrate, and silicic acid used aboard the R.V. *Pourquoi Pas?*, triplicates of KANSO international standards (refs: CA, CD, BZ and BW certified standards; KANSO, the general Environmental Technos Co., Ltd, Laboratory for Instrumentation analysis, 3-1-1, Higashikuraji, Katano, Osaka, 576-0061 Japan) were analyzed using the LEMAR CFA analyzer.

Table 1. Concentrations of KANSO standard solutions measured using the LEMAR AutoAnalyzer III compared to KANSO certified concentrations (μM).

	KANSO measured Concentrations	KANSO certified Concentrations	
	Uncertainty	Uncertainty	
Nitrite	0.028	0.018	0.004
	0.071	0.065	0.010
	0.075	0.069	0.010
Nitrate	5.45	5.63	0.05
	19.48	20.13	0.15
	24.4	25.18	0.20
Silicic acid	14.23	14.26	0.10
	39.96	37.46	0.23
	60.31	61.46	0.43

Table 1 shows that, in the range of the concentrations measured during the GEOVIDE cruise (nitrite: 0-1 μM ; nitrate: 0-25 μM ; silicic acid 0-60 μM), the KANSO measured concentrations were significantly different from the KANSO certified values. Plotting measured vs. certified concentrations of nitrite, nitrate and silicic acid given in Table 1, linear regression equations were calculated. The measured concentrations of the GEOVIDE samples were corrected, consequently.

2.1.4. Accuracy of the GEOVIDE measurements:

Concentrations of nutrients ($\mu\text{mol L}^{-1}$) are given with an accuracy of ± 0.01 for nitrite, ± 0.1 for nitrate and ± 0.2 silicic acid.

Nominally, the accuracy of the silicic acid concentrations should be $\pm 0.1 \mu\text{mol L}^{-1}$. However, given the potential interference of biogenic silica in unfiltered samples (concentrations <0.1 μM in the deep and bottom waters), we estimated the accuracy to be $\pm 0.2 \mu\text{M}$ for silicic acid.

2.2. Biogenic Silica

Biogenic silica (BSi) was determined from 2.3 L seawater samples filtered onto polycarbonate filters (0.6 µm pore size, diameter 47 mm) immediately after sampling. Filters were dried at 60 °C and stored for further analysis. BSi concentrations were analysed following Ragueneau et al. (2005). Briefly, a double wet-alkaline digestion is carried out where the filter sample is submitted to a first digestion (0.2M NaOH, pH 13.3) at 100 °C for 40 min. At the end of this first leach, all the BSi and part of the LSi have been converted into Si(OH)₄. Si and Al concentrations ([Si]₁ and [Al]₁) in the supernatant are analyzed. After rinsing and drying, the filter is submitted to a second digestion, exactly identical to the first one, leading to the determination of the (Si:Al)₂ ratio that is characteristic of the silicate minerals present in the sample. The corrected BSi concentration is thus given by:

$$[\text{BSi}] = [\text{Si}]_1 - [\text{Al}]_1 \times (\text{Si:Al})_2.$$

The detection limit is lower than 1.5 nmol of BSi present on the filter and the uncertainty is close to 10%.

2.3. Particulate organic carbon and nitrogen

Samples for concentrations of POC and PON were determined from 1.2 L seawater samples filtered onto pre-combusted glass fibre filters (Whatman GF/F, 25 mm diameter), rinsed with deionized, distilled water to remove salts, and then dried at 60°C.

POC and PON samples were analysed after fuming of the filter with concentrated HCl for 4 h in a dessicator and drying at 60 °C in an oven (decarbonation step) (Lorrain et al., 2003). POC and PON were measured using a Flash 2000 Organic Elemental Analyzer Thermo Scientific.
