In the paper “Wildfire overrides hydrological controls on boreal peatland methane emissions” by S. J. Davidson et al. (Biogeosciences, 16, 2651–2660, 2019), the following error occurred: we incorrectly referenced Turetsky et al. (2011) in the following statement:

However, disturbances such as wildfire can have a significant impact on the magnitude of C fluxes across peatlands (fire can release between 10 and 85 kg C m⁻² through combustion and smouldering; Turetsky et al., 2011), potentially causing a negative feedback to the climate (Randerson et al., 2006).

This statement should be attributed to Lukenbach et al. (2015). We now correct it here:

However, disturbances such as wildfire can have a significant impact on the magnitude of C fluxes across peatlands (fire can release between 10 and 85 kg C m⁻² through combustion and smouldering; Lukenbach et al., 2015), potentially causing a negative feedback to the climate (Randerson et al., 2006).
