SI Text S1 & S2

SI Table S1-S6

SI Figures S1-S9

SI Text S1 - Materials and Methods

For this study, three cores were investigated; Bass River (ODP 174AX; 39°36'42"N, 74°26'12"W (1)), drilled in 1996 by the Ocean Drilling Program and Meirs Farm (40°06'15.48"N, 74°31'37.48"W; (2)) and Fort Monmouth 3 (40°18'37.18"N, 74°02'46.25"W; (2)), drilled in 2008 by Rutgers University (K-Pg boundary drilling project (2)).

For palynological analyses, 90 oven-dried samples (~5-10 g dry mass) were analysed, 42 palynological samples from ODP 174AX Bass River, 35 palynological samples from Meirs Farm and 14 palynological samples from Fort Monmouth 3. Taxonomy used follows that of refs. (3, 4). Palynological samples were counted up to a ~250 dinocysts. Samples with a lower diversity (Shannon-H <2) were counted up to 400 dinocysts. After quantitative counts, slides were scanned for stratigraphically important taxa that were missed during quantitative counting. For benthic foraminiferal analysis, 31 samples of the Bass River core were analyzed. Samples were washed over a sieve with a mesh of 63 µm and ultrasonically cleaned. Only the size fraction of 125-630 µm was analyzed. Benthic foraminifera were identified using the taxonomy of refs (5-8).

SI Text S2 - Age Models

The age models for the studied cores are based on a combination of dinocyst, planktic foraminiferal and nannofossil biostratigraphy. Dinocyst biostratigraphy allows an excellent age control for the Maastrichtian of the New Jersey palaeoshelf (3).

The dinocyst marker taxa *Palynodinium grallator* and *Disphaerogena carposphaeropsis* have their First Appearance Datum (FAD) at ~67 Ma (9, 10) and are representative of the uppermost Maastrichtian *P. grallator* Zone of ref (11). The FO of the marker taxon *T. pelagica*, with a FAD approximately at 66.5 Ma, allows the subdivision of the *P. grallator* Zone into the *T. magdalium* and *T. pelagica* Subzones (11).

The age models of Meirs Farm and Fort Monmouth are based on refs (2, 3). The age model of Bass River on refs (1, 12) and this study.

SI Data

All data related to this publication are available in the Supplement and at the PANGAEA database (Vellekoop et al., 2019) <https://doi.pangaea.de/10.1594/PANGAEA.907070>.

SI Table S1 – Bass River dinoflagellate record (relative abundances)

SI Table S2 – Meirs Farm dinoflagellate record (relative abundances)

SI Table S3 – Fort Monmouth 3 dinoflagellate record (relative abundances)

SI Table S4 – Bass River dinoflagellate record (concentrations)

SI Table S5 – Meirs Farm dinoflagellate record (concentrations)

SI Table S6 – Bass River benthic foraminiferal record

Figure S1 Magnitude of late Maastrichtian warming estimated for three locations at the New Jersey Shelf: Bass River, Fort Monmouth 3 and Meirs Farm. The magnitude of Deccan Traps warming was estimated by comparing the weighted mean of the TEX₈₆-based temperatures (TEX_{86}^H , (13)) of refs. (3) and (14) in the pre-warming interval with the highest temperature in the warming interval. The gray band indicates the weighted mean of the calculated warming magnitudes.
