**Table S1.** Initial conditions of seawater sampled from Prydz Bay, Antarctica

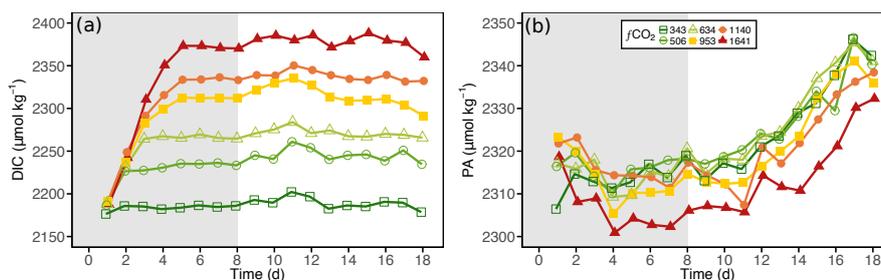

Condition	Value
$f\text{CO}_2$ , $\mu\text{atm}$	$356 \pm 6$
$\text{pH}_T$	8.08
DIC, $\mu\text{mol kg}^{-1}$	$2187 \pm 6$
PA, $\mu\text{mol kg}^{-1}$	$2317 \pm 6$
Temperature, $^\circ\text{C}$	$-1.03 \pm 0.17$
Salinity, PSU	34.3
NO <sub>x</sub> , $\mu\text{M}$	$26.19 \pm 0.74$
SRP, $\mu\text{M}$	$1.74 \pm 0.02$
Silicate, $\mu\text{M}$	$60.75 \pm 0.91$

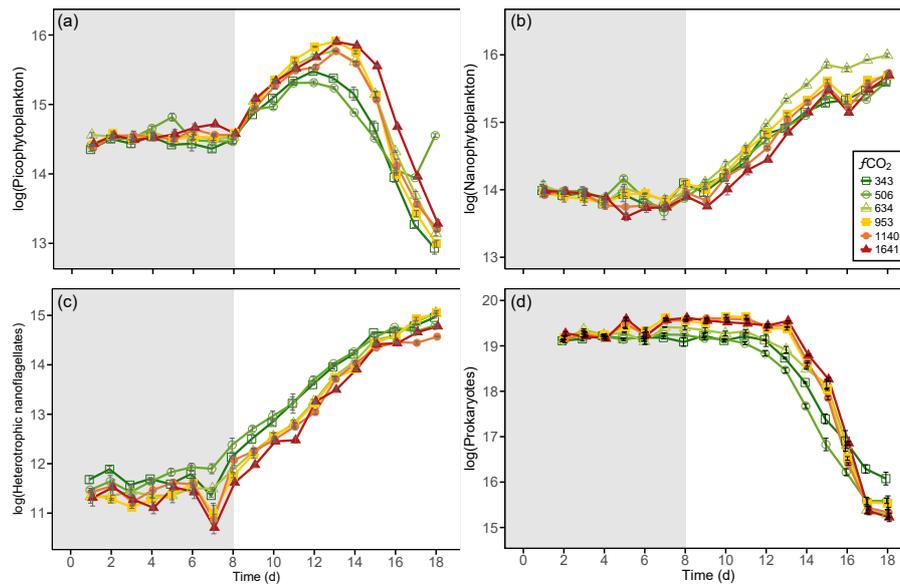

Data are mean  $\pm$  one standard deviation of all six minicosm measurements

**Table S2.** Flow cytometry flow rates and equations for counts

Instrument	Flow	Flow Rate ( $\text{ml min}^{-1}$ )	Analysed Volume Equation	$R^2$
FACScan	Low	7.5	$y = 0.0125x - 0.0127$	0.997
FACScan	High	36.5	$y = 0.0406x - 0.0098$	0.999
FACSCalibur	Low	15.6	$y = 0.0184x - 0.0074$	0.999
FACSCalibur	High	67.2	$y = 0.0710x - 0.0094$	1.00

Standard deviation of all flow rates was  $<0.004$

**Figure S1.** The (a) dissolved inorganic carbon (DIC), and (b) practical alkalinity (PA) carbonate chemistry conditions in each of the minicosm treatments over time. Grey shading indicates  $\text{CO}_2$  and light acclimation period.

**Figure S2.** Log-transformed abundance of (a) picophytoplankton, (b) nanophytoplankton, (c) heterotrophic nanoflagellates, and (d) prokaryotes in each of the minicosm treatments over time. Error bars display standard error of pseudoreplicate samples. Grey shading indicates  $\text{CO}_2$  and light acclimation period.
