We thank the reviewer for sharing his perspective about ecological modeling in general and our study in particular. We are glad that the reviewer appreciates our approach and understands that this work does not attempt to predict, but to get ecological insights into the global terrestrial P cycle. To do so, we addressed assumptions that we know must play an eventually important role for P availability at the global scale and thus for biosphere atmosphere interactions. We replied in detail to the questions rose by the first reviewer and submitted a revised version of our manuscript.
