Received and published: 7 March 2014

This is the third or more in a series of papers by this group on this subject. While there is some overlap with previous work, its not substantial and the quality is superior. Clearly they have done as good a job with methods as can be done with the instrumentation and models we currently have available, and their interpretation of the results is conservative yet robust. My only, very minor, critique is the language is dry and somewhat overly technical in places where more high impact wording could be used.
