Interactive comment on "Divergence of aboveand belowground C and N pool within predominant plant species along two precipitation gradients in north China" by X. H. Ye et al.

J. LIU

jianfeng.liu@wsl.ch

Received and published: 17 October 2014

The paper found that a shift of C/N pool between above- and belowground was not depending on the precipitation gradient, but species-specific. I think the results will be of important significance as a case study in developing or improving related processed model(s).
