Note regarding Tables and Figures:

The tables are difficult to assimilate, as is. I suggest you convert them to graphs where possible, including all age classes on a single graph, with time on the x-axis. This would present the data in a much more understandable and intuitive manner and should not require any more room.

The stacked bar charts are also difficult to assimilate, as is. I suggest you convert them to 'clustered' bar charts, instead. That will provide a more intuitive display of the changes within age classes
