COMMENT: Anonymous Referee #2 Received and published: 13 February 2015 This paper by Fu et al. reports a study on the spatial variability of N<sub>2</sub>O emissions from a tea field during the wet season in subtropical China. The authors measured N<sub>2</sub>O emissions using 147 chambers and applied three spatial interpolation methods to estimate the spatial distribution of the emissions. The findings highlight the importance of selecting an appropriate spatial interpolation method to provide a reliable estimation of regional N<sub>2</sub>O emissions. The paper makes a contribution to knowledge. The methodology is sound and the conclusions are supported by the results. The paper is well written and deserves publication. Just one minor edit: P.1488, L14: change “The” to “the”
