My congratulations for this nice piece of work! It is well done and was accepted by two experts without any critical comment. You succeeded to demonstrate the interaction of physics and biology with really excellent experiments and measurements, proving the action of fungi, which was a speculation (but only a speculation!) by Alfred Wegener already. The described phenomenon of hair-ice and the scientific background is of interest for the public, as it can be observed quite easily. Hair-ice looks beautiful and people will ask how these structures evolve. And those who never heard about it before can be alerted.
