One key point of this paper that I missed from my earlier comments:

When I got the response from author comments, I have been checked once again the research paper. At the same time, I also read the one of the referee comment. My missing point is that author used the Raman Unit (cm⁻¹) that can change the excitation-emission wavelengths and also at the same time the fluorescence intensity of the fluo-

C3088

rescence peaks. Such effect is problematic for future understanding of the fluorescence spectra of various components. Author can read this issue in the reference paper that I have been provided before. It has been elaborately discussed how the Raman Unit affects the peak wavelengths and also the intensity. I strongly suggest using the arbitrary unit (a.u.) or standard Quinine sulfate unit (QSU) instead of Raman Unit (cm⁻¹) and then rewrite the sections which are needed throughout the manuscript.
