

Interactive comment on “Ideas and perspectives: truffles not radioactive” by U. Büntgen et al.

Anonymous Referee #2

Received and published: 26 November 2015

This short paper is so special, it is almost humorous. Who had thought that the most expensive food on earth might ever be screened for radioactivity. That is what I call a piece of science. Nobody would have expected a significant internal exposure due to the consumption of truffles, but yet it is a radioecologically intriguing topic. Especially given the high public concern after nuclear accidents such as Chernobyl and Fukushima, a little more knowledge on the topic of radiological food safety must be appreciated. The style of the discussion paper is crisp and concise.
