

Interactive comment on “Organic carbon burial efficiency in a large tropical hydroelectric reservoir” by R. Mendonça et al.

Anonymous Referee #1

Received and published: 21 January 2016

The authors do not mention the problem of labile and non labile OC sediments. It is clear taht a significant part of OC buried is remobilized and mineralized as non organic compounds. But the authors could better discuss a question of role of reservoirs as a sink of carbon instead the source of biogenic gases to the athmosphere.
