

Interactive comment on “Microbiology and atmospheric processes: an upcoming era of research on bio-meteorology” by C. E. Morris et al.

Anonymous Referee #5

Received and published: 5 March 2008

This paper is a very informative and comprehensive piece of work in the areas of aerobiology and atmospheric sciences. I found many interesting references to research results in the area of atmospheric sciences. Of course, some numbers presented in the paper (for example Table 1) are of speculative nature and would probably be slightly adjusted in the future, however the global situation is delivered to the reader quite clearly. Moreover, I do not think that the authors' aim was to produce the paper, which would look like technical report detailing utilized monitoring procedures and corresponding results. It rather looks like some analytical review discussing current situation in the area and suggesting new research directions to be undertaken in the near future by multidisciplinary research groups consisting of microbiologists, physicists, applied mathematicians and others. Finally, I would like to say that the manuscript is well
