This is an excellent paper which is well constructed and well-argued. It will be read wisely and cited often. I especially liked the author's use of techniques such as magnetic susceptibility and BIT index. These were mentioned only briefly on p. 5169 and largely comprise simply the provision of references. I would like to see this small subsection slightly expanded in order to allow the authors to explain and justify the use of these techniques. I would like to see that authors explain clearly their choice of techniques. Only one or two sentences per technique will suffice. I recommend this in

C1264

order to make the paper more complete in itself and self-contained.
