Interactive comment on "Local flux-profile relationships of wind speed and temperature in a canopy layer in atmospheric stable conditions" by G. Zhang et al.

Anonymous Referee #1

Received and published: 6 July 2010

It is a very interesting and useful presentation of high quality measurements within a forest canopy. The analysis undoubtedly will have a significant influence on future parameterization efforts and design of experiments. The presentation on the usefulness of on various suggestions for the stability parameter is very interesting. I recommend this interesting and well written paper for publication and have no suggestions for changes.
