

Interactive comment on “Modelling burned area in Africa” by V. Lehsten et al.

Anonymous Referee #1

Received and published: 29 July 2010

the article has been deeply revised and I am happy with the current version, unless the editor has found structural problems that may limit publication quality. Most of the comments I made on the first version have been included. Those were related to human dimension of fires, ecosystem variability, seasonality of fire and fire regime characteristics. All details regarding the discussion of the relevance of Nesterov index and the importance of this study in relation to CO₂ have been clearly explained.
