Received and published: 12 April 2010

BG-2010-12 has been assessed by three reviewers producing assessments ranging from minor revisions (reviewer #3) to reject (reviewer #2). All three reviewers recommend on improving the paper in terms of clarity, structure and style and it seems to me that part of the critique results from an ambiguous description of processes and interpretation of the data. Generally the reviews include a lot of very instructive comments which the authors should consider in revising their paper. Any revision should be line-numbered and accompanied by a point-b-point reply to the reviewer comments.
