This paper “Characterization of broom fibers for PRB in the remediation of aquifers contaminated by heavy metals” is interesting and deserving to be published on the BGS, because it investigates in original manner on a very important problem. However I suggest, before the publication, some little arrangement. Specifically, the choice of the broom fiber as material for the PRB is very original, but the reader can ask the reasons to use broom fibers and not other fibers, like cotton or kenaf. Therefore I suggest to insert in the session “Conclusions” a brief sentence furnishing some explanation on this point and some justification to support this choice. Moreover I suggest to revise

C994

the English text.
