Received and published: 7 March 2011

It has been shown in various studies that fires in the humid tropics, and especially in tropical Southeast Asia with its vast areas of peat lands, contribute to large extents to CO<sub>2</sub> emissions, thus also affecting the global climate. And the island of Borneo is a notorious example regarding the amount and magnitude of annual fire events. To understand the climatic background of these devastating fires, this paper provides crucial information about the correlation between El Niño cycles, associated droughts and the magnitude of the fire events on that island. Covering a period from 1980 till 2000 and thus including five El Niño events, this paper extends our knowledge of El Niño related droughts into the past, which also helps to better understand the present situation and to make reliable future predictions. Due to the importance of detailed

information in that field, which facilitates further research, I strongly recommend the publication of this paper.

However, in order to prevent or mitigate such severe fire disasters in the future, it is of utmost importance to understand all factors controlling fire activity in that area. As the authors focus their study on the correlation between El Niño episodes, rainfall deficit and fire activity, they totally omit the human factor as another important element influencing fire activity. The authors indeed raise the topic of human influence by mentioning that large-scale transformation processes from natural ecosystems to degraded, and managed land cover types, which took place in the last 40-50 years, resulted in a fragmented landscape with many man-made ignition events. However, further analysis or elaboration on that point has not been undertaken in the paper. In this context it has to be mentioned that the passage within the abstract (page 976, line 3-7) might additionally mislead the reader to conclude that the human factor is only marginal, which is not the case. In order to clarify this I would appreciate if the authors could stress the importance of the anthropogenic influence as main cause of the fires on Borneo by elaborating on this aspect within the discussion and conclusion section as well as also including it in the abstract.

Technical corrections:

Page 976 line 2: “Borneo (Indonesia) is Earth’s third largest island . . .” I would recommend removing the word “(Indonesia)” because it might be confusing as Borneo also consists of other nations. However, if the authors wanted to point out the larger share of peat lands on the Indonesian part of Borneo, it should be done using an additional sentence.

Page 976 line 15: “(CAC)” please change to “(GAC)”

Page 980 line 17 and line 28: “Langner and Seighter, 2009” please change to “Langner and Siegert, 2009”.
