Hi Jerry, thank you for your reply. I do like your approach and I agree that point 4 is the real challenge given the heterogeneity of the sediments plus that of gas and gas hydrate distribution, which makes the applications of numerical models difficult. But we are a good way down the road to get a grip on number 3 and with increasingly better geological models and techniques to determine gas hydrate volumes I am sure uncertainties on the modeling data should decrease significantly. As mentioned in our earlier comment we added a paragraph (in A1.2) regarding the temperature conditions during degassing and the issues occurring due to this. As we do not refer to any data
