I suggest that you look at the DOC results from the Krycklan and Balsjö catchments in northern Sweden. There you find many articles on DOC and silviculture. In the december 2011 issue of AMBIO you also find two newly published papers on DOC from non-managed forests at four integrated monitoring sites located in south, southwest, central and northern Sweden. Follow the links below to find the published articles. The DOC patterns are much more complicated than you describe them.
