Whilst I would agree fully with Reviewer 3 that a full and proper test of the hypothesis advanced will have to involve manipulation and experimentation, I feel that this paper has significant merit in using observational data to frame the problem and derive the hypothesis. Furthermore, it may be that the process of Fe-DOC interaction described in the hypothesis is only significant or dominant in certain situations and this too will need to be researched and defined. Thus I would consider it likely that this paper will be influential in guiding the direction of future research in this area.
