Interactive comment on "Alteration of carbon, nitrogen, and phosphorus stoichiometry and their related enzymes as affected by increased soil coarseness" *by* Ruzhen Wang et al.

Anonymous Referee #3

The current work is interesting. The authors should consider few issues to improve the manuscript:

1) The authors should take into consideration about absorption/inhibition of enzymatic activity by clay particles.

2) The authors focus on organic carbon and dissolved organic carbon. But, what about humic substance?
