

Supplemental Material

Tab. S1: Strains selected from each habitat used in this study. The four most representative strains from isolation plates for rock (r), groundwater (gw) and soil (s) samples from Middle Muschelkalk (MM) or Lower (LM) were selected. 16S rDNA sequence accession numbers are given in parentheses (Genbank).

rLM	rMM	gwLM	gwMM	sLM	sMM
<i>Bacillus</i> sp. rLMa (KX527723.1)	<i>Arthrobacter pascens</i> rMM19	<i>Flavobacterium limicola</i> S_5.3 (KR088468.1)	<i>Arthrobacter</i> sp. W_2.1 (KX570903.1)	<i>Agromyces cerinus</i> sLM10 (KX536506.1)	<i>Agrococcus jejuensis</i> sMM51 (KX527688.1)
<i>Bacillus muralis</i> rLMd (KX527725.1)	<i>Bacillus</i> sp. rMM8 (KX527696.1)	<i>Lelliottia amni-gena</i> S_H3 (KR088478.1)	<i>Planococcus</i> sp. W_1.2 (KR088481.1)	<i>Bacillus</i> sp. sLM42 (KX536514.1)	<i>Moraxella osloensis</i> sMM16 (KX527667.1)
<i>Bacillus simplex</i> 3.3F (KX527719.1)	<i>Psychrobacillus psychrodurans</i> rMM20 (KX527705.1)	<i>Pseudomonas</i> sp. S_H4 (KX573101.1)	<i>Rhodococcus erythropolis</i> W_Sd5 (KX570908.1)	<i>Streptomyces</i> sp. sLM17	<i>Sphingopyxis bauzanensis</i> sMM41 (KX527680.1)
<i>Micrococcus luteus</i> rLMc (KX527724.1)	<i>Ochrobactrum intermedium</i> rMM23 (KX527707.1)	<i>Rhizobium</i> sp. S_4.1a	<i>Advenella</i> sp. W_Sd3 (KR088492.1)	<i>Streptomyces</i> sp. sLM8 (KX536505.1)	<i>Streptomyces</i> sp. sMM10 (KX527665.1)

Tab. S2: Strains isolated from rock (r), groundwater (gw) and soil (s) samples from Middle Muschelkalk (MM) or Lower (LM) identified by 16S rDNA sequencing. The affiliations to kingdoms (classes for Proteobacteria) are given.

Strain	Organism	Affiliation	Strain	Organism	Affiliation	Strain	Organism	Affiliation
Rock Lower Muschelkalk, outcrop Jena Formation (51125583, 11707340/57)			Groundwater Lower Muschelkalk, Stöben (5660183, 4478864)			Soil Lower Muschelkalk, quarry Bad Kösen on Jena formation (51125376/427, 11709132/319)

Fig. S1: Biominerals visualized by scanning electron microscopy. *Bacillus flexus* rLM1.5 (A), *Comamonas koreensis* W_5.3b (B), *Bacillus* sp. rMM10 (C) are shown, each for an overview of crystal shapes, partly covered with organic matrix, and high magnification to give insight into surface and microcrystalline structures. Some minerals are settled by bacterial cells leaving holes after lysis.

Fig. S2: Interactions with effects on formation of biominerals. More crystals were produced in the interaction zone between *L. amnigena* S_H3 and *Pseudomonas* sp. (A), crystal formation was reduced at the contact zone between *Micrococcus luteus* rLMc and *Bacillus muralis* rLMd (B). *Moraxella osloensis* sMM16 vs. *Agrococcus jejunensis* sMM51 showed overgrowth (C).
