

***Interactive comment on “Reviews and syntheses: Anthropogenic perturbations to carbon fluxes in Asian river systems: Concepts, emerging trends, and research challenges” by Ji-Hyung Park et al.***

**Anonymous Referee #1**

Received and published: 26 February 2018

This review article presents a very nice, pleasureable to read, comparative summary of CO<sub>2</sub> fluxes in some of the largest Asian Rivers. Or, to be more correct, it presents a summary of the existing knowledge and of the challenges remaining as at present there is much less information on carbon fluxes in these large systems that what is available for the large river systems in the US or Europe. The review covers a good range of the published research in the chosen river systems (Mekong, Yellow and Ganges rivers) and also discusses some of the data from other systems in the region.

This leads me to my main comment: I was wondering why the authors have not discussed the Red River in Vietnam or Pearl River in China? There is a body of work on

C1

both of these rivers. The authors don't need to go into great detail on the Red River, but I do think it merits a mention in the review.

I found the figures to be appropriate but perhaps the quality of Fig. 3. could be improved.
