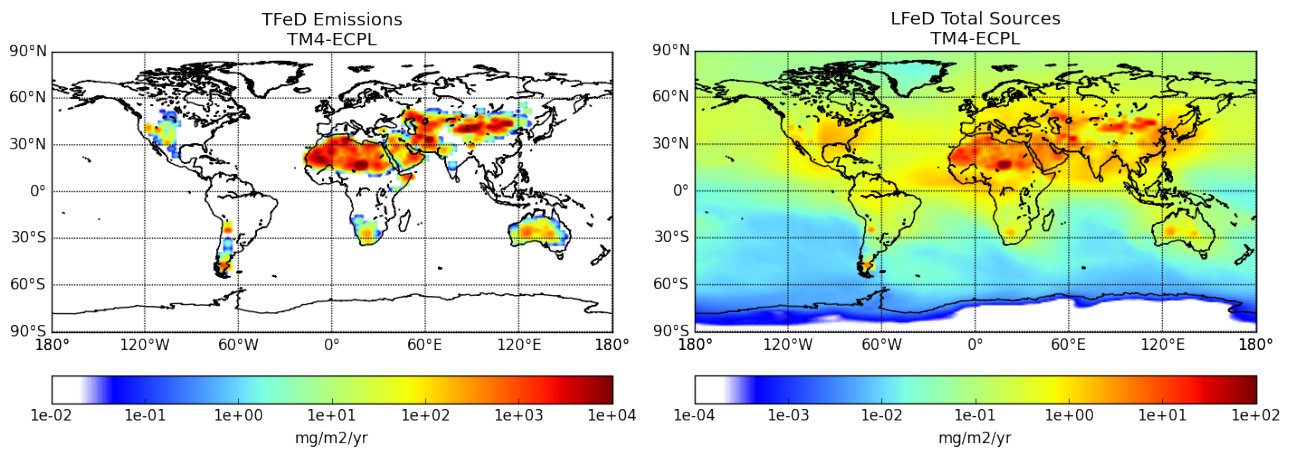

Figure S4: Annual mean TFe emissions and LFe sources (i.e., emissions and atmospheric processing together) (in mg-Fe m⁻² yr⁻¹) from mineral dust, taken into account in (a,b) CAM4, (c,d) GEOS-Chem, (e,f) IMPACT and (g,h) TM4-ECPL.

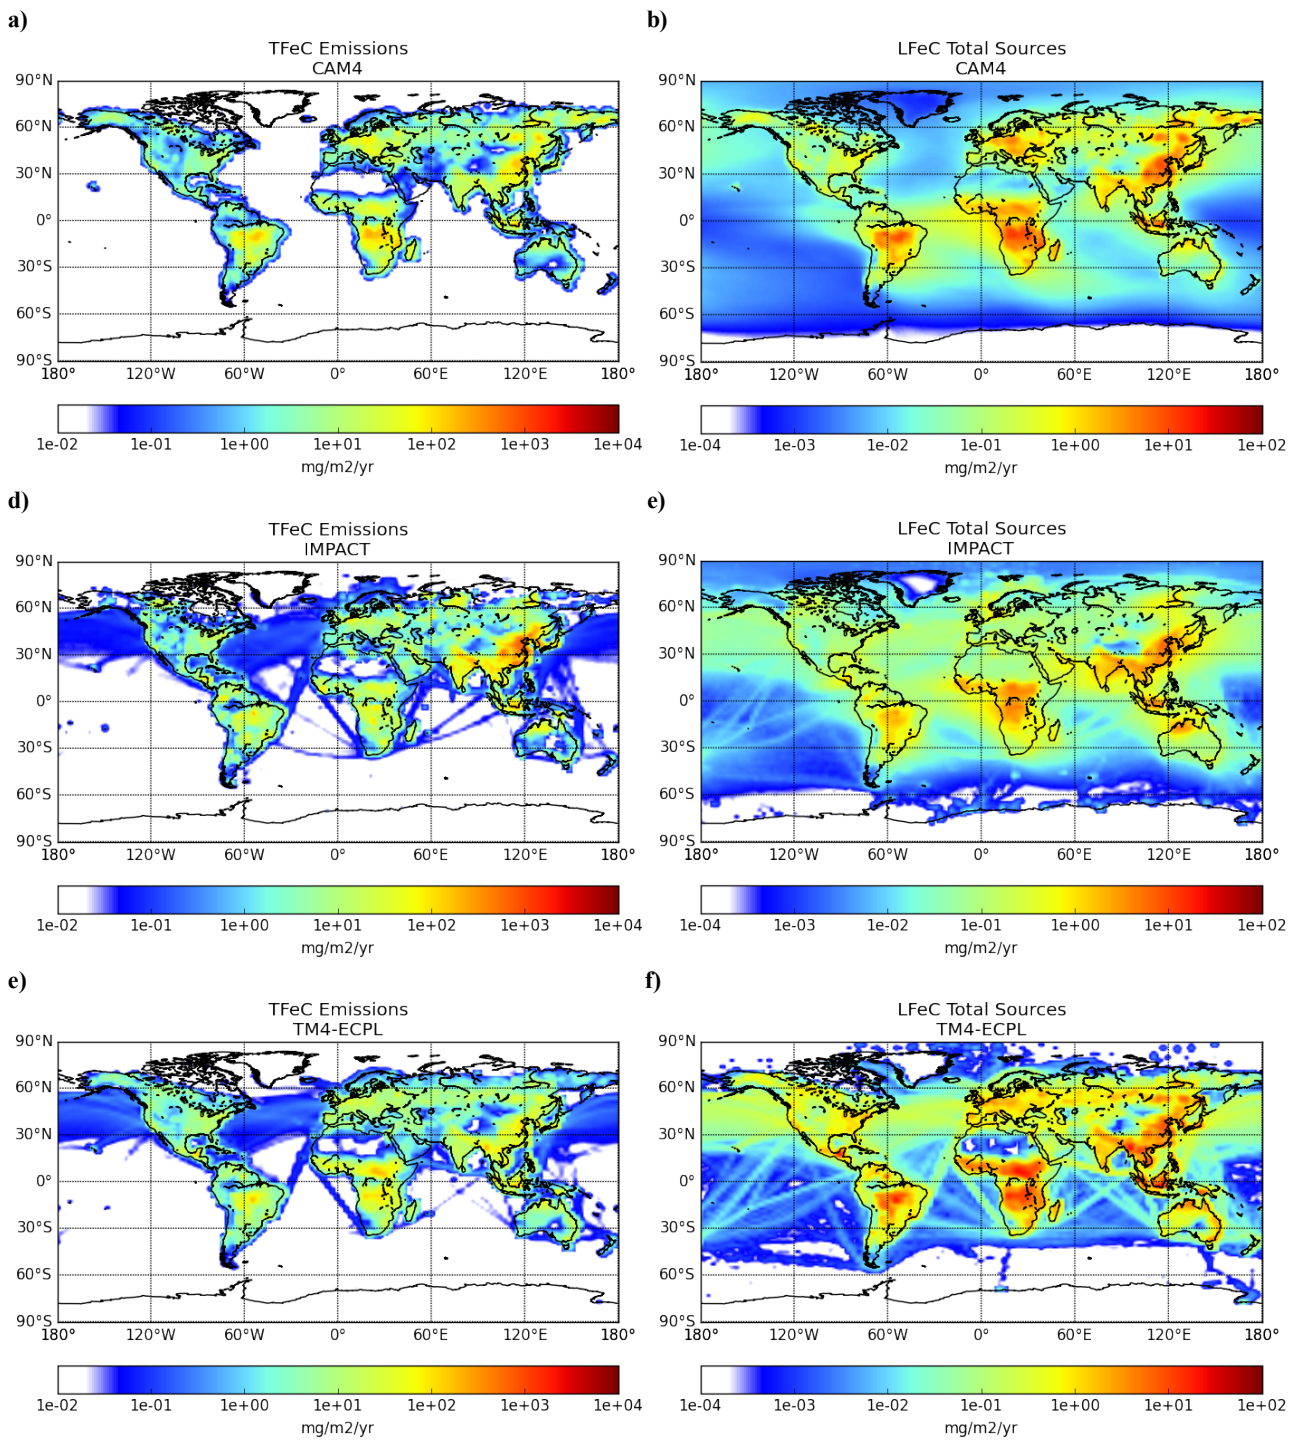

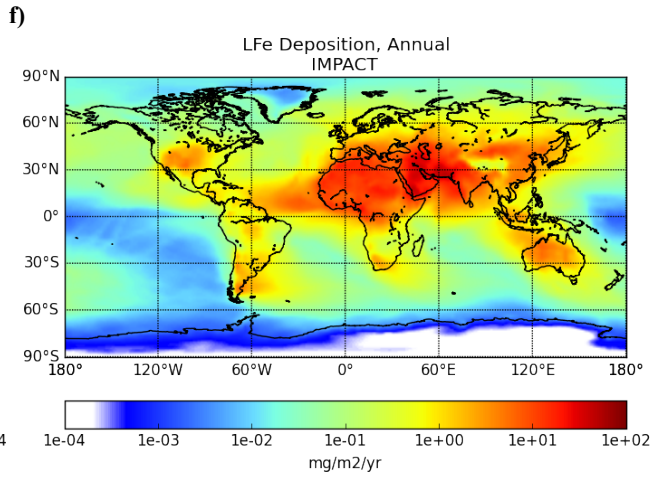

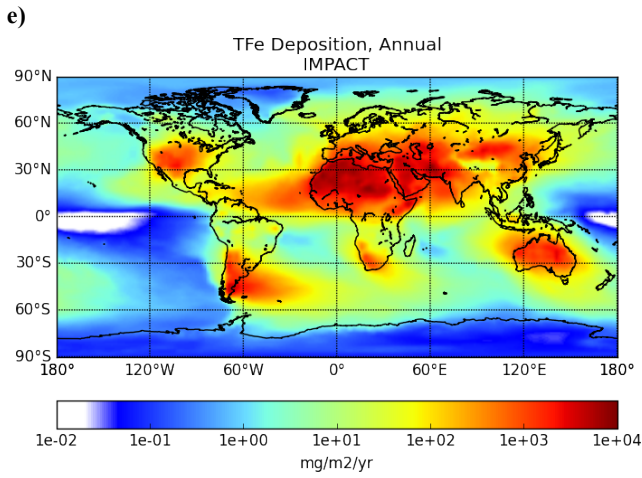

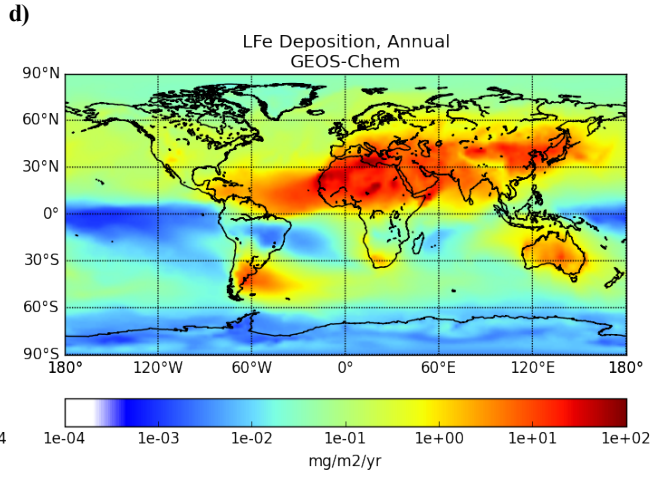

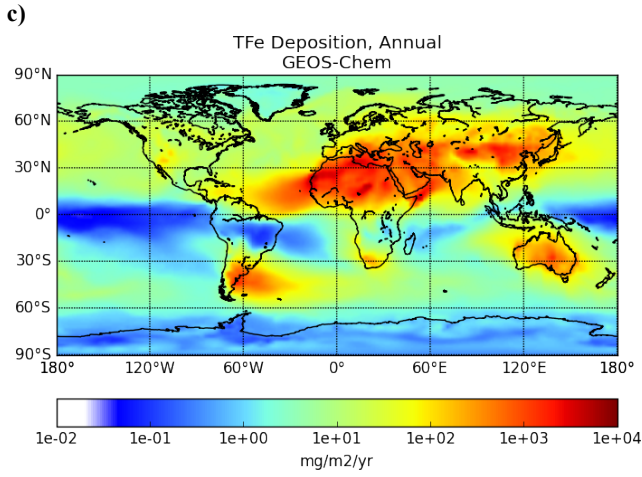

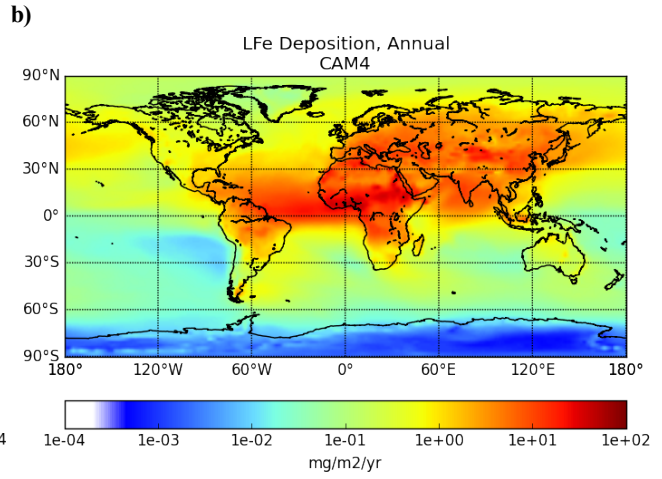

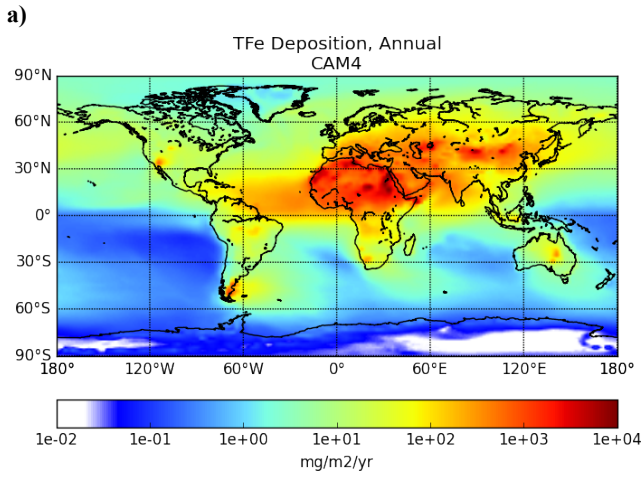

Figure S5: Annual mean TFe emissions and LFe sources (emissions + atmospheric processing) (in $\text{ng-Fe m}^{-2} \text{s}^{-1}$) from combustion processes, taken into account in (a,b) CAM4, (c,d) IMPACT and (e,f) TM4-ECPL.

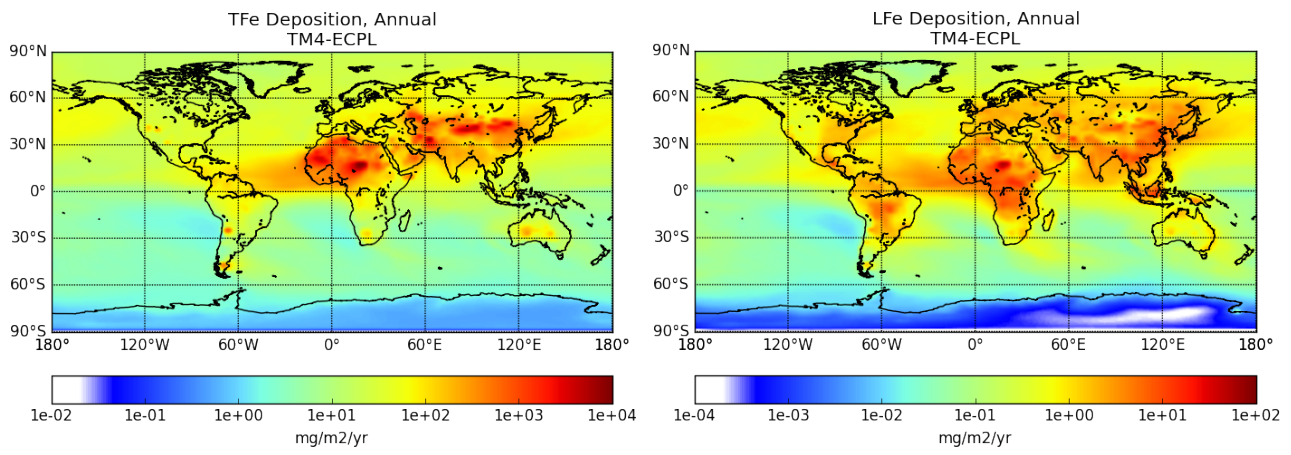

Figure S6: Annual TFe (left) and LFe (right) total (dry+wet) deposition fluxes (in $\text{mg-Fe m}^{-2} \text{ yr}^{-1}$) from mineral dust and combustion sources (in GEOS-Chem only the Fe from mineral dust is considered), as calculated by (a,b) CAM4, (c,d) GEOS-Chem, (e,f) IMPACT and (g,h) TM4-ECPL.

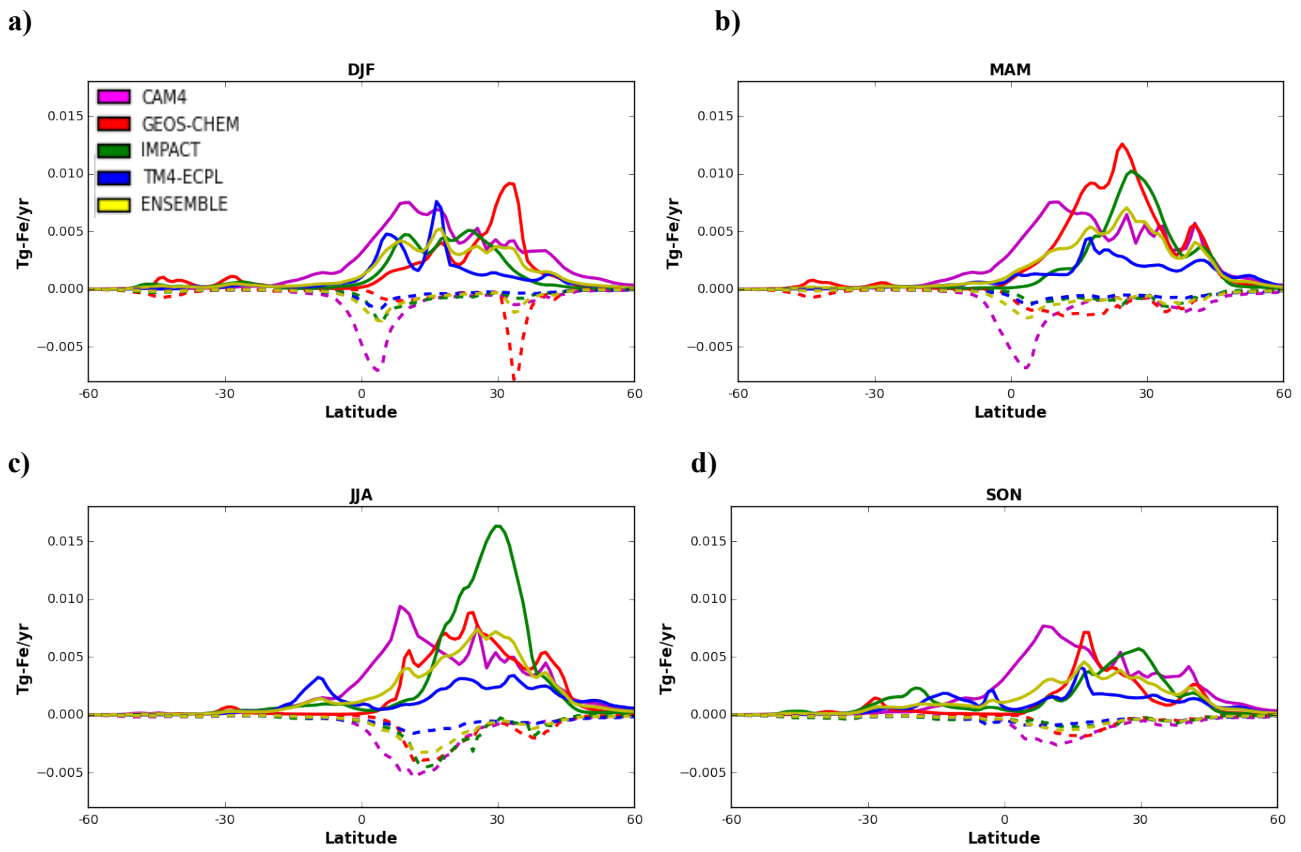

Figure S7: Latitudinal variation of LFe global sources (positive/continuous lines) and oceanic deposition fluxes (negative/dashed lines) in Tg-Fe yr^{-1} , for a) December, January and February (DJF); b) March, April and May (MAM); c) June, July and August (JJA) and d) September, October and November (SON), as calculated by each model (CAM4: magenta; GEOS-Chem: red; IMPACT: green and TM4-ECPL: blue) as well as the ENSEMBLE model (yellow).

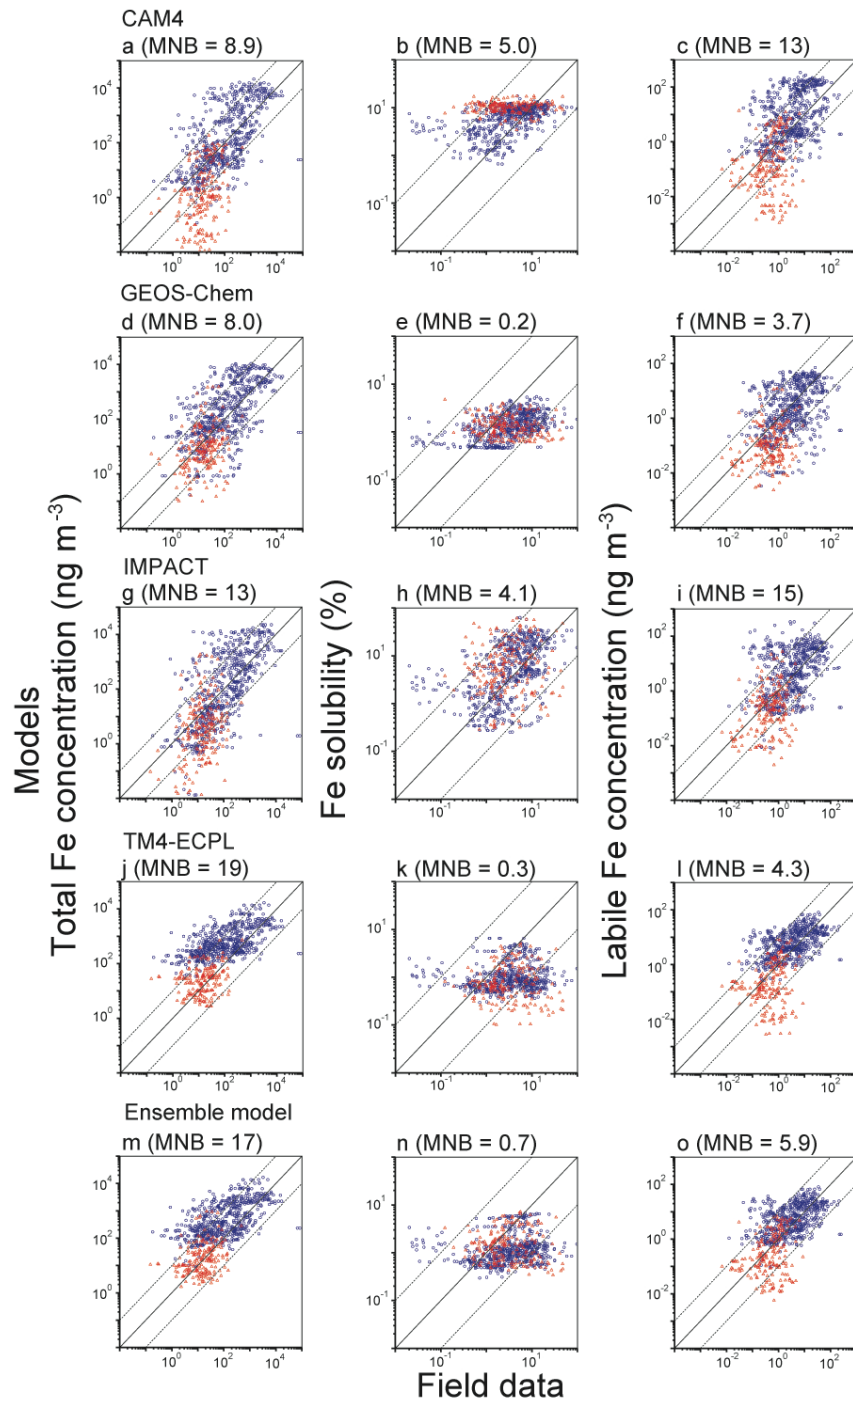

Figure S8: Same as Fig. 4, but the case before the bias correction procedure of Eq. 1. Shown are ensemble model comparisons against observed TFe loading (ng m^{-3}), Fe solubility (%), and LFe loading (ng m^{-3}) in the Northern (blue circles) and Southern (red squares) Hemisphere.

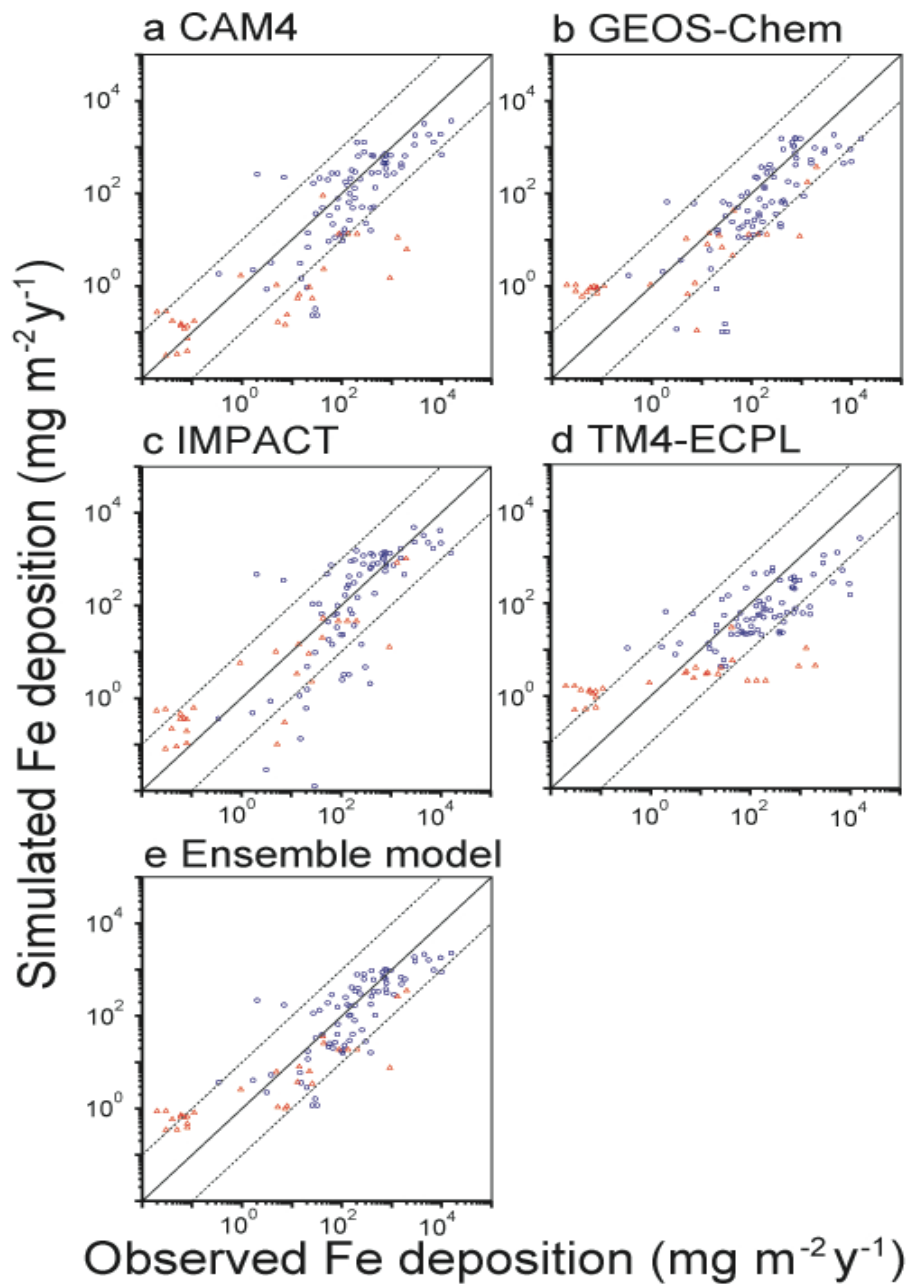

Figure S9: Atmospheric deposition (in $\text{mg-Fe m}^{-2} \text{yr}^{-1}$) of TFe for (a) the compilation of measurements from Albani et al. (2014), (b) CAM4, (c) GEOS-Chem (d) IMPACT, (e) TM4-ECPL and (f) the ENSEMBLE model. The bias correction in the mineral dust size distribution is applied for the comparison with field data (Kok et al., 2017).
