Dear editor,

I was recently pointed to this manuscript on the role of ENSO on the methane cycle. The manuscript argues for a limited role of ENSO on the methane cycle; however, the manuscript makes little mention of two important factors that impact atmospheric methane and are strongly influenced by ENSO: **(1) atmospheric transport** and **(2) loss via hydroxyl**. These factors seem particularly pertinent to a discussion of the role of ENSO on the methane cycle. There have been a number of recent papers on these two topics in the last two years that the authors seem to have overlooked. Specifically, McNorton *et al.* (2016), Turner *et al.* (2017), and Rigby *et al.* (2017) showed

how changes in the methane loss via oxidation by hydroxyl was an important factor in the interpretation of methane trends. More directly related to ENSO, Corbett *et al.* (2017) showed the influence of ENSO on the spatial distribution of methane via changes in atmospheric transport while Turner *et al.* (2018) showed how ENSO can strongly influence the methane lifetime.
