Responses to Reviewer 1

We thank the reviewer for the positive comments to the paper and suggestions that have improved the manuscript.

Dear author Thanks for the author Lobo-do-Vale et al present the study entitled with Drought reduces tree growing season length but increases nitrogen resorption efficiency on a Mediterranean ecosystem. It is interesting and also crucial important to add the knowledge on the influences by climate extremes (in particular for growing

C1

seasons) on Mediterranean ecosystems. The paper has shown a lot of information (phenophases such as bud development, budburst, shoot growth, and nitrogen resorption efficiency) based on the rich data collected in extreme drought years of 2005 and normal year of 2004. Personally, I quite like these topics and results, it well-fits for the research scopes of Biogeosciences. But there are a lot of descriptions and sentences are not clear for whole paper. Two main suggestions: - one is to analyse the variables with the aridity index including temperature and precipitation together, such as SPEI or others

Answer: The SPEI index in our study can only be used to characterize the two climatologically contrasting years, because each year can only be associated to one unique SPEI value. However, for reference we have now included the SPEI computed on a 6-month period prior to growing season (March). SPEI was, respectively for 2004 and 2005, -0.4 (mild year) and -1.7 (dry year). We also added a reference on SPEI. Page 5 lines 3-6 and Page 7 lines 19-21.

- Second, the authors should take more time on the grammar, logic and structure for the whole paper.

Answer: We thank the reviewer. The paper was thoroughly checked and improved. A version with tracked changes is attached.

Abstract - Line 5: Please describe directly the sentence, such as the contrasting years of extreme drought in 2005 and moderate year in 2004.

Answer: We modified the sentence as: “In this study, we compared the spring phenology of cork oak trees (*Quercus suber*), an evergreen species, over two contrasting years, a mild year (2004) and dry year (2005), which was the most severe drought since records exist.”. Page 1 lines 14-16

- Line 15-18: Please short the sentence and represent your main purposes for this paper. Answer: We modified the sentence as: “We evaluated the timing of occurrence,

C2

duration, and intensity of bud development, budburst, shoot elongation, trunk growth, and leaf senescence (phenophases) and assessed the nitrogen resorption efficiency from senescent to green leaves.”. Page 1 lines 16-17

- Line 21: Is it -21% or 21%?

Answer: We modified the sentence as: “Shoot elongation was also reduced (-21 %). . .”.
Page 1 line 20

- Line 24: Is it +22% or 22%

Answer: Our option to use +22% was to emphasize the increase in NRE. Page 1 line 23

- Which results are the crucial finding in your abstract, please highlight it.

Answer:.. Abstract was improved to highlight our findings

Introduction Page 2 - Line 6: Which ecosystem services, please add them.

Answer: We corrected the sentence because the cycling of carbon, water and nutrients are also ecosystem services. The sentence was modified as follow: “Shifts in plant phenology have broad consequences for ecosystems, not only directly through changes in the cycling of carbon, water and nutrients, but also indirectly through feedbacks on the climate system (Diez et al., 2012; Richardson et al., 2013; Tang et al., 2016; Han et al., 2018)., which in turn may strongly influence ecosystem productivity (Tang et al., 2016)”. Page 2 lines 4-7

- Line 7: Please add the details on the complex and highly variable

Answer: We corrected the sentence to be more specific: “However, the response of species phenology to climate change is complex and highly variable, depending on species, spatiotemporal scales (seasonal or annual), or main climate driver (precipitation, temperature or both) (Penuelas et al., 2004; Polgar and Primack, 2011; Diez et al., 2012; Tang et al., 2016; Gerst et al., 2017)”. Page 2 lines 7-9

C3

- Line 7-8: Are you sure all of the citations relate to this clarity. And the paper has stacked several studies, please check the whole paper whether they are well-correlated to your sentence.

Answer: All the citations and references were confirmed. We modified the sentence to: “It is critical to have a better understanding of the patterns and climate drivers of the different phenophases in a broader range of tree species (Lempereur et al., 2017; Tang et al., 2016; Polgar and Primack, 2011; Richardson et al., 2013; Doblas-Miranda et al., 2015;)”. Page 2 lines 10-11.

- Line 14: Do you test the aridity including both temperature and precipitation, such as SPEI for the aridity site such as Mediterranean basin.

Answer: As was mentioned above, the SPEI index in our study can only be used to characterize the aridity of the two years, because each year can only be associated to one unique SPEI value. We now refer the two values of SPEI for both years. Page 7 lines 19-21

- Line 16-18: Although these studies are correlated with the clarity, need to reduce these citation number.

Answer: Although each citation was quite interesting, we reduced the citation number.
Page 2 line 17

- Line 19-20: Which information is scarce?

Answer: Information of the impact of precipitation changes on tree phenology. We corrected the sentence as following: “Still, available information on the effects of precipitation on phenology is scarce”. Page 2 line 19

Page 3 - Line 15-27: Please add the aridity including temperature and precipitation.

Answer: There is no information available, as far as we are aware, relating directly to the effects of aridity on NRE.

C4

Page 7 - Line 26: Is it $p < 0.05$? please check them whole paper.

Answer: The results indicated that the test result was not significant, thus $p > 0.05$ is right. The budburst occurred at similar DDS in the two years, but later in the dry year because the winter was cooler. Now line 27

- Line 21-22: I do not find the two years are contrasting, but similar for the temperature, please recheck.

Answer: We deleted the words "These two years were also contrasting" because in fact only winter of the dry year was colder and the other seasons had similar temperature records.

Page 8 - Line 8 and 13: Is it $p > 0.05$? check for the whole paper

Answer: The results indicated that the test result was not significant, thus $p > 0.05$ is right. Bud development showed similar duration in both years as well as the onset of the trunk growth.

Page 13 - Do you have the graph or data to show the correlation? If not, please add it.

Answer: Figure S4 was added to supplemental material regarding the correlations mentioned in Page 13 lines 1-6.

- Line 14-15: Is it necessary to discuss here, maybe better put it in discussion section.

Answer: Those lines were eliminated, as the information was also provided in the discussion section, Page 17 lines 7-12.

- Line 17: If you used the BAI instead of basal area increment, please continue to use it after the first definition.

Answer: This has been done on Page 13 line 17.

- Line 18: Please also show the regression in the supporting figure.

Answer: This has been done on Page 13, line 17. The supporting figure was added to C5

supplemental material, Figure S5 and referred in text: "BAI was weakly but positively related with Amax at the onset of the growing period ($BAI (\%) = -0.777 + 0.357 \text{ March Amax}$, $r^2 = 0.18$, $p < 0.05$, Fig. S5)", Page 13 line 18

Page 14 - Line 8: Do you compare the values between years? Why use "among"?

Answer: "among" has been changed to "between" throughout the entire manuscript, e.g., Page 4 line 2, Page 7 line 27, Page 14 line 8, Page 18 line 20 and Page 19 line 29.

- Line 14: What it means for "considered globally", and there is no regression in the graph.

Answer: By "considered globally" we meant all data, or the overall correlation. The sentence was corrected to "Furthermore, NRE was closely explained by [Nse] ($NRE = 97.19 - 6.13 [Nse]$, $r^2 = 0.97$, $p < 0.0001$; Fig. S5b)", Page 14 line 14. Also the regression was added to supplemental material, Figure S7b.

- Line 15-16: Why discuss the result not in the discussion section?

Answer: Those lines were eliminated, as the information was also provided in the discussion section, Page 19 lines 19-21.

Page 16 - Line 5: Why use "among"?

Answer: This was a mistake and has been corrected throughout the entire manuscript on Page 1 line 20, Page 7 line 26, Page 14 line 8, Page 13 line 5, Page 18 line 23 and Page 19 line 31.

- Line 8-9: Are you sure the citations mentioned the same results with yours?

Answer: We believe all the citations we provided are highly relevant in the field of Phenology and well support our sentence, by showing an effect of temperature on leaf unfolding, budburst or the onset of vegetation greenness (for studies based on satellite data). We therefore kept the cited references. Page 16 lines 7-8.

Page 19 - Line 11: This sentence is not understandable, please restructure it

Answer: The sentence has been corrected as “(Delarco et al., 1991). [Ngr] in the mild year, was within the range of values observed in other studies (Delarco et al., 1991; Escudero et al., 1992; Oliveira et al., 1996; Kattge et al., 2011). Nonetheless, Andivia et al. (2009) reported a higher variation in [Ngr] over the growing season.”, Page 19 lines 9-11
