We would like to thank the reviewer for this and their previous reviews. We hope that the below address the reviewers concerns raised here.

We will go through and update Table 1 and the model descriptions to clarify the models which were modified-CENTURY (which are generally cascade models) and models which are direct implementations. We've removed "CENTURY" from the Temperature column of Table 1 and replaced it with a generic function with a citation to the CENTURY paper in the caption. We apologize for the confusion.

The van Gestel manuscript is a fascinating data set that we look forward to addressing directly in future studies. We've added a comment to this effect in the discussion and

C1

to the section where we discuss the statistical power of the dataset.
