>Reviewer 2 >Review of: “Interferences of volatile organic compounds (VOC )on methane concentration measurements” by Kohl et al. >The paper studies experimentally the interferences of several VOCs on the measurement results of several CH<sub>4</sub> analysers. VOCs interfere strongly with FTIR but not with laser absorption spectroscopy measurements of CH<sub>4</sub>. The results indicate that the FTIR instruments are not suitable for CH<sub>4</sub> measurements in high-VOC conditions, e.g. when estimating CH<sub>4</sub> fluxes from plants or soil. Laser absorption spectrometers are much less affected by

Discussion paper

VOC interference, thus can be used in high-VOC conditions. Including the main VOCs in the FTIR library corrects for part but not all the interference on methane. A by-product of this study is the finding that VOCs can be quantified by FTIR, at least at the high concentrations used here. >The paper is very useful given the recent increase in attention to CH<sub>4</sub> emissions from or via trees, and the increasing availability of field capable instruments. The paper is well written and I recommend publication after the comments below are addressed.

>General comments >R2.1 I think it is important to discuss the relevance of these findings for the recent studies of methane emissions from trees (e.g. summarized in Covey et al., 2019). Did any of these studies use FTIR instruments?

We are unaware of any published tree CH<sub>4</sub> flux data that used FTIR based instruments. Many of the studies summarized by Covey et al use gas chromatography to quantify CH<sub>4</sub> (which is not vulnerable to the interferences described herein), while some of the more recent studies quantified CH<sub>4</sub> by laser spectroscopy (Picarro and LGR instruments). We are, however, aware of several groups currently considering the use of FTIR instruments for stem flux measurements. We therefore think that the reliability of currently available data is not impacted by our work, but that this manuscript is important as the potential use of FTIR for tree stem flux measurements would decrease this data reliability in the future.

>R2.2 “Concentration” is not the correct term for molar ratios (i.e. all the quantities expressed as ppm or ppb). “Mole fraction” or “mixing ratio” should be used instead.

Changed to ‘mixing ratio’ throughout the manuscript. We kept the more commonly used term ‘concentration’ in the title.

>R2.3 An explanation is missing on how the VOCs to be tested were chosen. Are these representative for real world emissions from vegetation?

Clarified as requested. p3 L3-5 now read “We chose the tested compounds to repre-

[Printer-friendly version](#)[Discussion paper](#)

sent a cross-section of naturally occurring VOCs and aimed to cover different chemical compound classes rather than the most important biogenic VOCs occurring in any given environment."

>R2.4 The VOC concentrations used in the lab experiments seem quite high. Are these representative for what one can expect in a tree chamber? Consider mentioning this in the method already. Also, when discussing the sensitivities of CH<sub>4</sub> to VOCs, it would be useful to relate to real world expected VOC levels.

See response to R1.4. We added the new Sections 2.5 and 3.5, Fig. 7, and Tables 1 and 4 to provide estimates for VOC mixing ratios reached during chamber closures.

>R2.5 not all VOCs from Test 1 were used in Test 2 –why? Did the ones that were removed not have an influence? Especially alpha-pinene, which the authors mention it is the main VOC emitted by spruce.

Due to time constraints and limited instrument availability. While the tests conducted during Experiment 1 took around 1h per compound, tests in Experiment 2 took one overnight run per compound. We chose the VOCs tested to cover a broad diversity of chemical compound classes (monoterpenes, methanol, aliphatic and aromatic compounds). Unfortunately, we ran out of our alpha-pinene standard during experiment 2 and therefore used  $\beta$ -pinene and  $\Delta^3$ -carene to represent monoterpenes.

>R2.6 two different FTIR instruments were used, one in the field campaign and Test 2, and the other one in Test 1. Are these similar enough that the results can be considered together? If yes, please state in the text. Otherwise they should probably be treated separately through the paper.

Clarified as requested. These are very similar instruments (DX4040 is the portable version of DX4015). They have the same measurement cell, detector technology, and spectral deconvolution software. p4 L16-18 now read "[...] we replaced the FTIR-based analyser with a portable but otherwise similar model [...]"

>Specific comments >R2.7 at the end of Introduction the authors state that the test setup was built. I suggest adding one sentence stating clearly what is presented in this paper: the field experiments? or the lab test setup? the results of both?

Modified as requested. We added the following sentence at the end of the introduction "In this communication, we present results from field measurements and laboratory tests, as well as a first sensitivity analysis for the impact of VOC interferences on measurements of CH<sub>4</sub> fluxes from different ecosystem compartments." (p2 L28-30)

>R2.8 page 2 lines 14-19: the phrase is a bit long and hard to follow, with some commas missing. Please consider reformulating.

Modified as requested. p2 L19-21 now read "This is especially important in the study CH<sub>4</sub> emissions by plants as plants co-emit a complex mixture of volatile organic compounds (VOC) at fluxes 2 to 4 orders of magnitude higher than currently reported CH<sub>4</sub> fluxes [references]."

>R2.9 page 3 lines 6-7: specify what the in house pressured air supply is based on: e.g. gas cylinder(s) or a large compressor taking outside air. This is relevant for how the uncertainty is calculated (page 4, and see comment below)

Clarified as requested. The air was taken from a compressor using outside air. (p3 L18)

>R2.10 page 3 line 21 and page 4 line 9: are  $\delta^3$ -carene and  $\Delta^3$ -carene the same chemical?

Corrected. This should be a uppercase delta in all cases. (p4 L23)

>R2.11 Fig. 3: Caption –specify the experiment these data come from. For panel a, the text says “development of VOC concentration” but only beta-pinene is shown.

Changed as requested. The caption to Fig 3. now starts "Exemplary results from Experiment 1, shown for tests conducted with  $\beta$ -pinene."

>R2.12 page 4 lines 22-30: if the in house supply of pressured air takes atmospheric air from outside, there will be non-random variations on diurnal time scales, with e.g. possibly large methane increase during night. Is this taken into account in the bootstrap, i.e. are the 500 time intervals from the same part of day as the VOC experiments? Or was the day/night variation in the inhouse air estimated?

The data used for bootstrapping was collected during nighttime (7pm to 7am). Experiment 2 runs were started between 10am and 4pm and ran until 1am to 8am. This means that there is indeed a small potential that we underestimated non-random variations in CH<sub>4</sub> concentrations that occurred during daytime. This affects mainly gradient challenges, which were conducted before the stepwise challenges in the same run.

The bootstrapping approach was employed to account for the added uncertainty due to drifts in the inlet CH<sub>4</sub> mixing ratio. These additional uncertainties were largely symmetrical, which suggests that periods of increasing and decreasing CH<sub>4</sub> concentrations were equally represented in the data used for bootstrapping. We conducted every individual challenge (VOC / analysers / stepwise-or-gradient combination) at least twice, with >1.5h (gradients) or >4h (stepwise) between measurement. Overall, we think that in spite of diurnal variations estimates still represent a fairly conservative estimate for the true uncertainty in our experiments.

>R2.13 Fig. 4: I find some parts of Fig. 4 confusing. In panels a and b it is not easy to understand which trace corresponds to which y-axis. E.g., in the upper middle panel, do the methane data correspond to the blue unlabeled scale, or to the side scales labelled "CH<sub>4</sub>"? What does the blue y-axis represent, and what are the units? Consider splitting the panels. Similar for panels g, h, i. Also, please consider splitting Fig 4 into two figures.

Changed as requested. We split Fig 4 into two separate figures (new Figs. 4 and 5), removed three panels, and revised the corresponding figure captions.

>R2.14 page 5 Sect 3.1: suggest to refer to Fig 1.

[Printer-friendly version](#)[Discussion paper](#)

Changed as requested. We moved the reference to Fig 1 up by one sentence to meet the first mention of data from Fig. 1 in this paragraph (p6 L9).

>R2.15 page 7 line 13: was alpha-pinene not included in Test 1?

No. While we did screened for (and detected) interferences by  $\alpha$ -pinene in experiment 1, but we did not conduct quantitative measurements of  $\alpha$ -pinene interferences (hence, we note that they were not quantified.)

> Text comments: >R2.16 page 1, line 7: typo“strong strong”

Corrected (p1 L9).

>R2.17 page 2 line 29: typo “Summer”

Corrected. (p2 L4).

>R2.18 page 3 line 6: “Fig 3a” –should it also be “Fig 2a”, since this is the setup decription?

Corrected (p3 L17).

>R2.19 page 3 lines 9-10: “The flowair” –should it be “the air”?

Corrected (p3 L21).

>R2.20 page 3 line 29: “measure of VOC interferences” should be “measure the VOC interferences”?

Changed to "measure VOC interferences". (p4 L10)

>R2.21 page 3 line 30:“Fig 3b” –should it be “Fig 2b”?

Corrected (p4 L11).

>R2.22 page 4 line 25: “those by a random period” should be “by those from a random period”

Printer-friendly version

Discussion paper

Corrected (p5 L10).

>R2.23 please check-page 4 line 29: “Significance interference” should probably be “Significant interference”

Corrected (p5 L 14).

>R2.24 page 4 line 31: “to evaluate”-page 4 line 32: “we evaluated calculating” should be “we calculated” ?

Corrected (p5 L17).

>R2.25 page 5 line 26: probably typo: [spikes?]

Corrected to ‘outliers’. (p6 L30)

>R2.26 page 6 line 10: typo “/beta”

Corrected (p7 L15).

>R2.27 page 6 line 14: I think “and not part of ...” should be “was not part of ...”

Corrected (p7 L 19).

>R2.28 page 6 line 15: “)” missing after “VOCs”

Corrected (p7 L20).
