S Supplementary material

This document includes supplementary figures and tables, containing data that is described or shown in other forms in the manuscript.

In Fig. S.1, the locations of core sites for observed benthic $\delta^{13}C$ are indicated, and Holocene (HOL) observed benthic $\delta^{13}C$ 5 is compared to the bottom water ocean distribution of $\delta^{13}C$ for $Ctrl_{RED}$. The positions of observation sites are the same as in Peterson et al. (2014).

For comparison with Fig. 3a, we show the surface PO_4 concentration (μM) of the control state with fixed Redfield stoichiometry ($Ctrl_{RED}$) (Fig. S.2).

For comparison with Fig. 5, which shows model ocean $\delta^{13}C$ of model version *RED* compared to observations, we show 10 the corresponding ocean sections for model version *GAM* (Fig. S.3).

The supplementary tables S.1 and S.2 list diagnostic variables for climate (Table S.1, model versions *RED* and *GAM*, all ensemble members), carbon and nutrients (Table S.2, all model versions, all ensemble members). Table S.3 lists model–data comparison statistics for the *Ctrl* and *GLcomb* simulations in each of the model versions *RED* and *GAM*, and for the two benthic $\delta^{13}C$ data time slices HOL (0–6 ka) and LGM (19–23 ka).

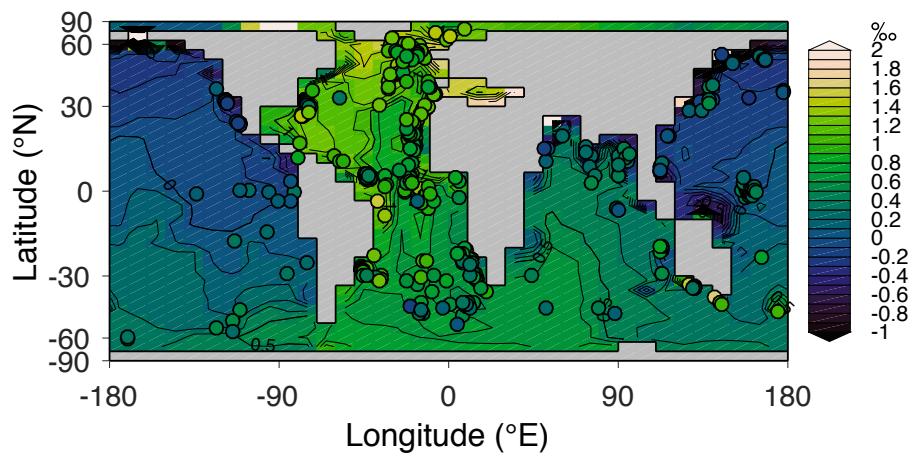

Figure S.1. $Ctrl_{RED}$ bottom water ocean $\delta^{13}\text{C}$ (contours) compared to the Holocene (HOL) time slice of observed benthic $\delta^{13}\text{C}$ (circles) of Peterson et al. (2014).

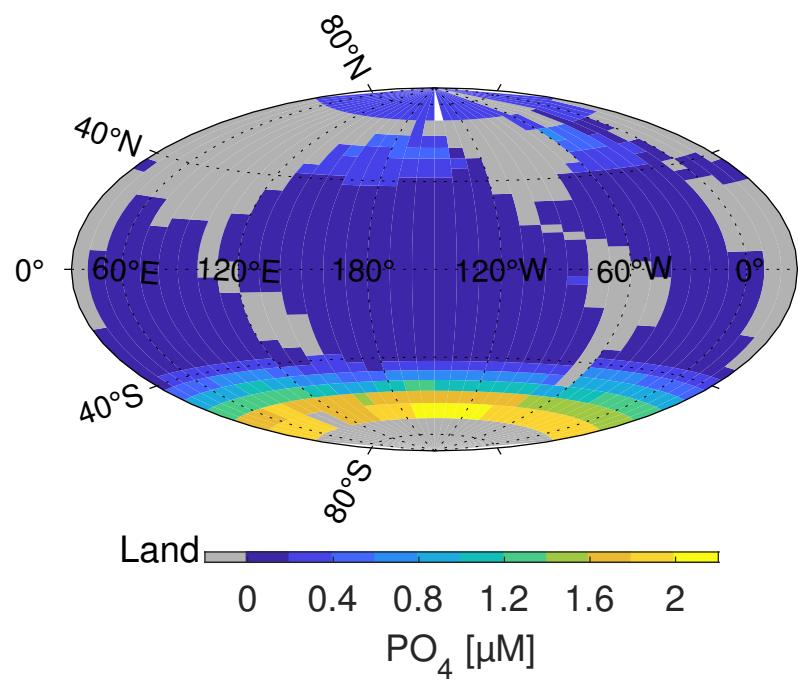

Figure S.2. Surface PO_4 concentration (μM) of the control state with fixed Redfield stoichiometry (Ctrl_{RED}).

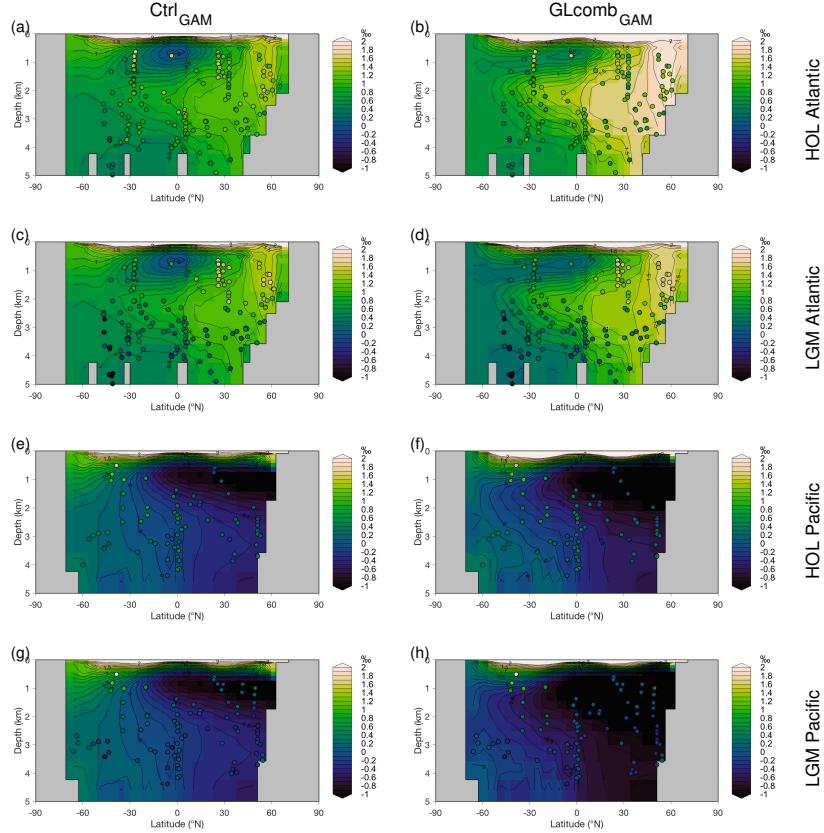

Figure S.3. Model ocean $\delta^{13}\text{C}$ (contours) compared to the two time slices (HOL and LGM) of observed benthic $\delta^{13}\text{C}$ (circles) of Peterson et al. (2014). Left hand column shows Ctrl_{GAM} (panels a, c, e, g) and right hand column shows $\text{GLcomb}_{\text{GAM}}$ (panels b, d, f, h). The rows show, from top to bottom, a-b) HOL Atlantic, c-d) LGM Atlantic, e-f) HOL Pacific, g-h) LGM Pacific. Note that, when we compare $\text{GLcomb}_{\text{GAM}}$ to LGM observations (panels d and h), a constant of 0.32 ‰ is subtracted from $\text{GLcomb}_{\text{GAM}}$ data, to account for terrestrial release of $\delta^{13}\text{C}$ -depleted terrestrial carbon.

Table S.1. Carbon and nutrient variables in control states (*Ctrl*) and ensemble members (Table 1) of model versions *RED* and *GAM*. The columns list global ocean values for C/P ratio in the export flux of organic matter (dimensionless quantity), total content of DIC (DIC_{cont} , PgC), average concentration of DIC (\overline{DIC}_{tot} , $\mu mol kg^{-1}$), average concentration of remineralised DIC (\overline{DIC}_{rem} , $\mu mol kg^{-1}$), average concentration of remineralised acidic carbon (\overline{AC}_{rem} , $\mu mol kg^{-1}$), average concentration of PO_4 (\overline{P}_{tot} , $\mu mol kg^{-1}$), average concentration of remineralised PO_4 (\overline{P}_{rem} , $\mu mol kg^{-1}$) and average of the nutrient utilisation efficiency (\overline{P}^*). The modern ocean observed C/P is given as determined by Anderson and Sarmiento (1994) and the global ocean carbon inventory (DIC_{cont}) is estimated to 38,700 PgC (Stocker, 2014). The observational estimate for \overline{P}^* is given by Ito and Follows (2005).

Table S.2. Climatic variables for all control states ($Ctrl$) and ensemble members (Table 1). The variables are atmospheric CO_2 (pCO_2^{atm} , ppm), global averages of temperature in the ocean (T_{avg}^{oce} , °C) and in the atmosphere (T_{avg}^{atm} , °C), transport in the Atlantic meridional overturning circulation (AMOC, Sv) and sea ice cover (%). The observational estimate for $\overline{T_{oce}}$ has been calculated using the World Ocean Atlas 2013 (Locarnini et al., 2013). Average modern day AMOC strength is estimated by McCarthy et al. (2015) from the RAPID-MOCHA array at 26° N. Modern day sea ice cover is given as an interval due to seasonal variability (Comiso, 2008). No observational estimate for $\overline{T_{atm}}$ is given, since modern atmospheric observations are strongly influenced by rising pCO_2^{atm} (Stocker, 2014).

Experiment acronym	pCO_2^{atm} (ppm)	T_{oce} (°C)	$\overline{T_{atm}}$ (°C)	AMOC (Sv)	Sea ice (%)
Observ.	278	3.49	N/A	17.2 ± 0.9	3 to 6

$GLcomb_{121}$	206.2	1.93	6.86	12.02	10.3

Table S.3. Model–data comparison statistics for the *Ctrl* and *GLcomb* simulations in each of the model versions *RED* and *GAM*, and for the two benthic $\delta^{13}\text{C}$ data time slices HOL (0–6 ka) and LGM (19–23 ka). Correlations are computed between benthic observations and model water mass $\delta^{13}\text{C}$ in the grid cell corresponding to the observation depth. Standard deviations (STD) are the normalized values (STD_{model}/STD_{data}), which are scaled by the number of observations.

Model – data	Global corr.	Global STD	Atlantic corr.	Atlantic STD	Indo–Pacific corr.	Indo–Pacific STD
<i>Ctrl_{RED}</i> – HOL	0.78	1.23	0.50	0.83	0.39	0.81
<i>Ctrl_{GAM}</i> – HOL	0.76	1.38	0.45	0.94	0.36	0.95
<i>GLcomb_{RED}</i> – HOL	0.76	1.82	0.46	1.22	0.34	1.10
<i>GLcomb_{GAM}</i> – HOL	0.76	2.11	0.44	1.46	0.33	1.31
<i>Ctrl_{RED}</i> – LGM	0.58	0.96	0.64	0.43	0.06	0.83
<i>Ctrl_{GAM}</i> – LGM	0.55	1.08	0.58	0.48	0.01	0.96
<i>GLcomb_{RED}</i> – LGM	0.58	1.40	0.61	0.62	0.06	1.07
<i>GLcomb_{GAM}</i> – LGM	0.57	1.62	0.60	0.74	0.02	1.28
