The statements about converting V-SMOW to V-PDB on Page 6, lines 5-15 are not correct. The -0.27‰ offset does not convert SMOW to PDB - this is an offset correction that is necessary because we use isotope values from two different standardizations in this empirical equation. Note that the SMOW and PDB scales are ~30‰ different so -0.27‰ does not convert one to the other as you state. Please reword this in your methods so that the statement is accurate.
