

Supplement

Figure S1: Accumulated precipitation in 2015 and during the reference time period. Shaded areas in red and grey mark the non-haze drought and the haze drought period in 2015, respectively.

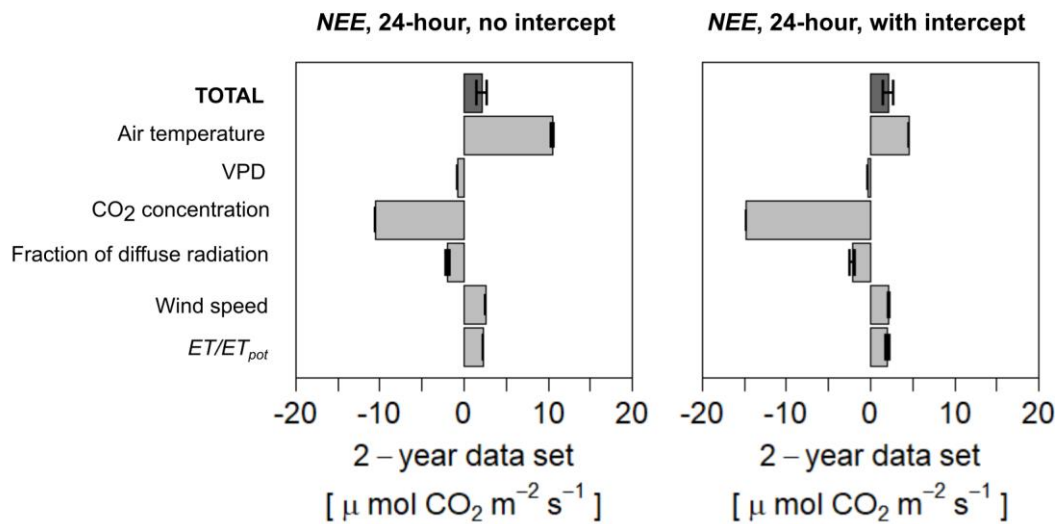

Figure S2: Comparison of Multiple Linear Regression Model (MLRM) results without (left) and with (right) intercept on 24-hour net ecosystem CO₂ exchange (NEE) during the entire study period (2014-2016). Error bars show the standard error.

Table S1: Contribution (\pm standard error) of meteorological parameters (predictors) on net ecosystem CO₂ exchange (*NEE*) derived from multiple linear regression model (*MLRM*) during different time periods (full 2-year study period, non-haze drought, haze drought, and non-haze & non-drought conditions). Negative values indicate CO₂ uptake for 24-hour *NEE* and midday *NEE*, and CO₂ release for night time *NEE*. If not otherwise stated, measurement height is 22 m above the surface.
