32 **1. Sampling details**

33 Based on visualization in Google Earth we estimate that the maximum distance  
34 drifted may be approximately 1 km for measurements in the river channel up  
35 and downstream of the reservoirs. In sheltered areas located in bays and over  
36 islands with standing trees, where the water flow was very low, drifting was very  
37 short and caused by wind. An estimate of the drifting distance in the natural  
38 river channel and in the main channel of the Xingu Reservoir was obtained by  
39 using the average water velocity measured by the National Water Agency of  
40 Brazil at the Altamira station. We separated the historical values into before and  
41 after 2016, when the dams were completed. Therefore, representing estimates  
42 of water velocity in the natural river (between 2005 and 2016), and in the Xingu  
43 Reservoir main channel (after 2016). The average water velocities at Altamira  
44 are 0.74 and 0.24 m s<sup>-1</sup> for before and after the dam, respectively. Assuming  
45 that there is no resistance of the boat with the water or air, drifting speed is  
46 similar to the water velocity. The total time of deployment was up to 30 minutes  
47 for the three consecutive measurements. Based on these we found that in the  
48 main channel of the Xingu Reservoir the drifting distance would be 432 m, and  
49 1332 m for the natural river channel up and downstream the reservoirs.

50 **2. Depth profiles**

51 During high water of 2016 and 2017 we registered depth profiles for physical-  
52 chemical variables through whole sampling area. We measured water column  
53 pH, depth, dissolved oxygen (DO), conductivity and temperature using a  
54 multiparameter probe (EXO2®, YSI). The depth profiles were registered until  
55 near bottom depth (approximately 80 % of total depth) to avoid sediment  
56 interaction. Total depths are listed on table 1 of the manuscript. Depth profile  
57 tables are presented by year and flow order, respectively.
