Thank you for this nice review giving further insights into new partitioning approaches for evapotranspiration.

As far as I can tell, a typo crept into page 8, line 13 and line 19: Scanlon and Sahu (2008) introduced for the variance of CO₂ due to stomatal uptake the variable σ_{cp} , and "cr", however, stood for the soil CO₂ source. Thus, maybe to avoid confusion with the former publications about this method, this variable label could be adapted.
