This manuscript was well constructed and I enjoyed reading it. I am always glad to see explorations of tree-ring growth and isotopes in systems that have not previously been studied using these techniques. In the attached PDF document I provide detailed comments about what, in my view, could most improve the clarity and impact of the manuscript. The outstanding request I make, that will require more substantial work, is that your calculation (and associated analyses) be switched to using a conventional big delta D13C carbon isotope discrimination rather than reporting small delta d13C

values that were corrected with a pseudo-discrimination value.
