

Interactive comment on “Functional convergence of biosphere–atmosphere interactions in response to meteorology” by Christopher Krich et al.

Anonymous Referee #1

Received and published: 28 October 2020

I wanted to add also that I can see the tremendous, deep work that went into this analysis, presumably with a lot of thought about how to visualize highly complex physical/spatial/temporal processes. I do think that the analysis has real promise, and the figures (once understood by the new reader) convey a huge amount of information at once. That said, all of that work and promise goes unrealized without a compelling question motivating the narrative. I think the real work to be done now is in the manuscript, and much less in the methods. With that motivating narrative I think this work could be a very insightful paper.

My apologies for not highlighting the real potential in this work more clearly in the original review comment.
