**Supplementary Figure 1:** *n*-Alkane distribution of the Sobo-Sise Yedoma cliff. Depths are indicated above graphs in meters above river level (arl). The dominant *n*-alkane chain length is indicated in the upper right corner. We found n-alkanes of chain length C<sub>14</sub>-C<sub>33</sub>. Concentrations are expressed in µg/gTOC.

**Supplementary Figure 3 (continuation):** Fatty acid (FA) distribution of the Sobo-Sise Yedoma cliff. Depths are indicated above graphs in meters above river level (arl). Concentrations are expressed in  $\mu\text{g/g TOC}$ . See Supplementary Table 2 for a list of identified FAs and their compound classes.
