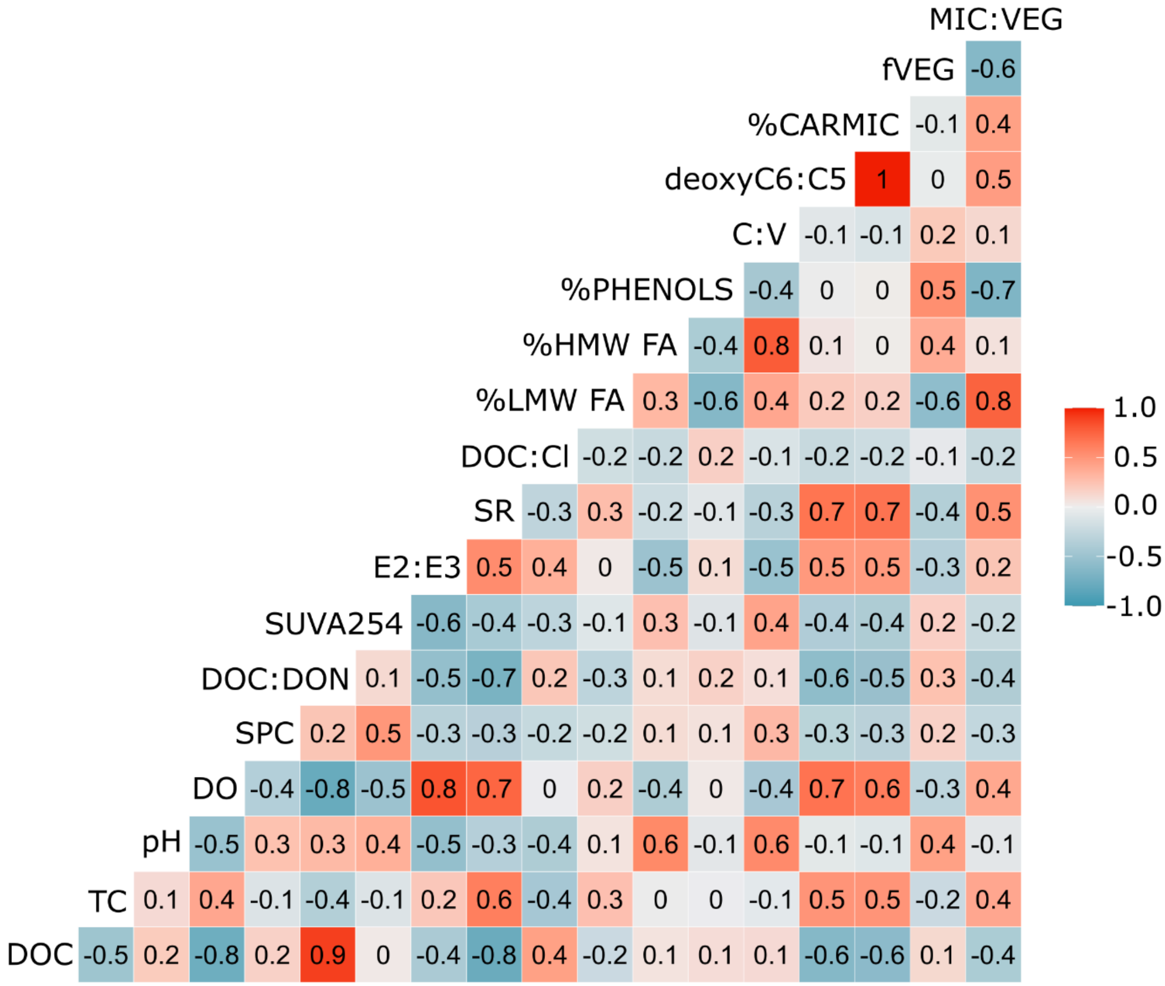

Figure SI.1. Correlation plot of punctual variables as physico-chemical parameters (water temperature, pH, dissolved oxygen and specific Conductivity), DOC concentrations, DOC:DON ratio. DOC:Cl ratio, absorbance indices ($SUVA_{254}$, E2:E3 ratio and S_R), and molecular index (deoxyC6:C5 ratio, fVEG, C/V ratio), molecular family proportions (%Phenols, %SmallOrganicAcids, %Microbial Carbohydrates, %LowMolecularWeight FattyAcids, %HighMolecularWeight FattyAcids).

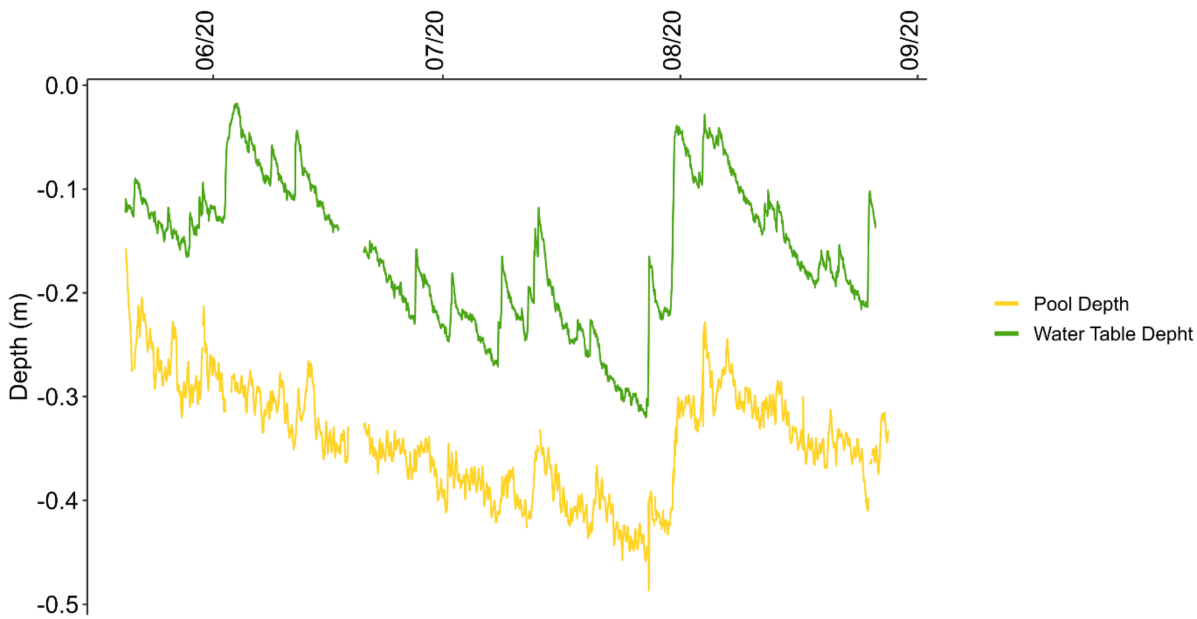

Figure SI.2. Variation of pool depth as the difference between peat surface at a reference point and water surface and water table depth at the reference point.

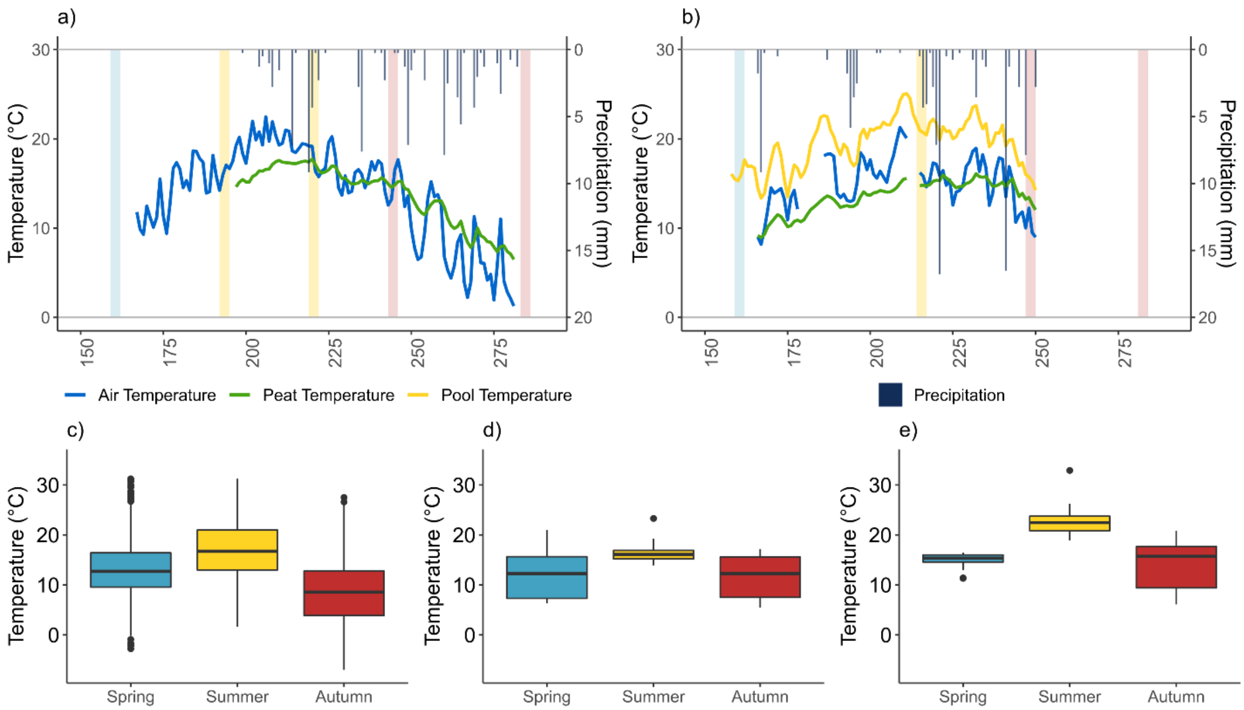

Figure SI.3. Daily average air, peat temperature and pool temperature (for 2019 exclusively) and precipitation in a) 2018 and b) 2019. Vertical band represented sampling period and color depending on seasons (blue = spring, yellow = summer, red = tumn). Box plot of seasonal c) air temperature, punctual measurements of d) peat porewater and e) pool water temperatures. For boxplot, box represented the lower (25th percentile) and the upper quartile (75th percentile) and median (50th percentile), whiskers represented the interquartile range.

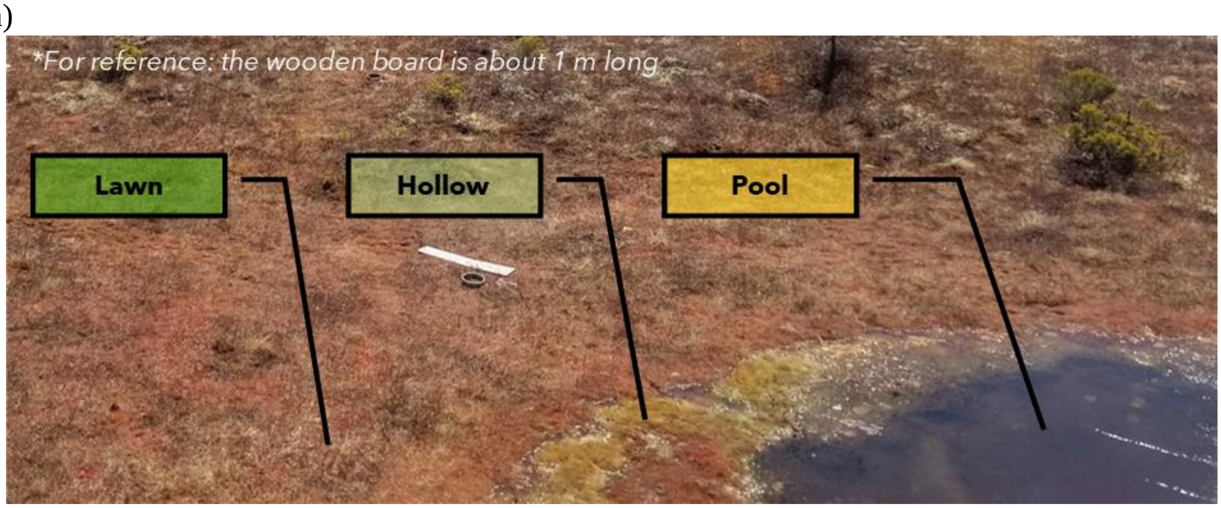
a)



b)

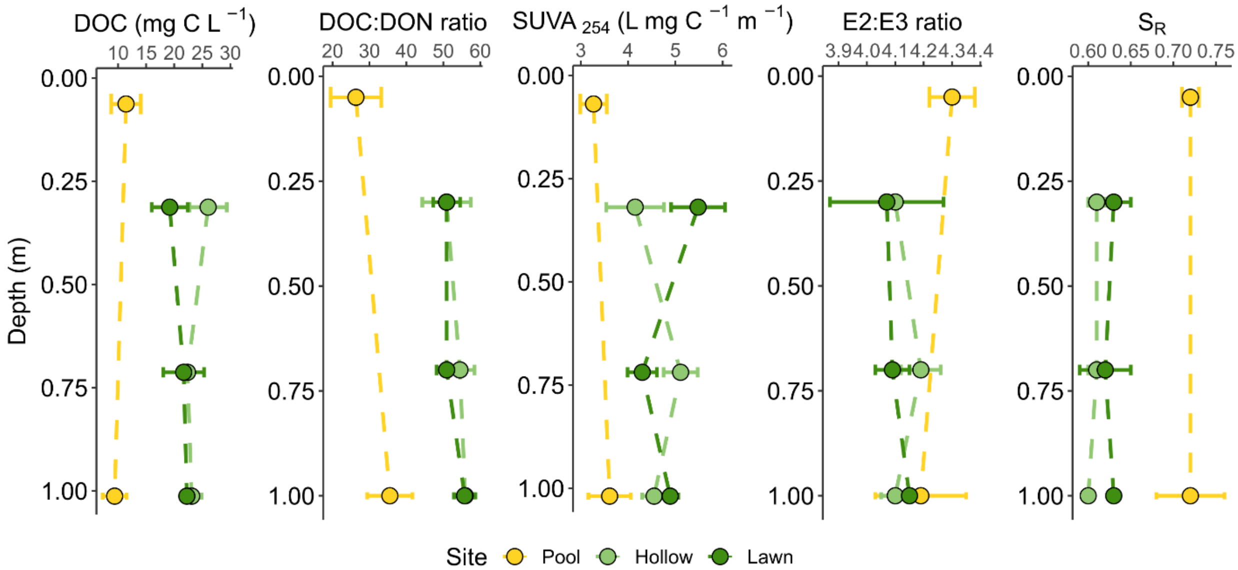


Figure SI.4. a) Picture of the sampled pool, hollow and lawn. **b)** Variations of DOC concentrations (in mg C L^{-1}), DOC:DON ratio, $SUVA_{254}$ (in L mg C^{-1} cm^{-1}), E2:E3 ratio and spectral slope ratio in two contiguous microforms (one lawn and one hollow) and their adjacent pool (M11 on Fig. 1) at 3 depths in peat porewater (-0.3 m, -0.75 m and -1 m) and at the surface and in depth of the pool. Samples were taken in June, August, and September 2019. Points represents the average of each variable and error bar the standard deviation. Variables were always significantly different between pool and lawn and pool and hollow, except for E2:E3 ratio, but never significantly different between lawn and hollow.

Table SI.1. List of compounds analyzed by THM-GC-MS and their related *m/z* and mass specra factor (msf) used for their integration and molecular groups associated with them

Table SI.2. Results of statistical tests for physico-chemical variables (water temperature, pH, dissolved oxygen and specific conductivity), DOC concentrations, DOC:DON ratio, absorbance indices ($SUVA_{254}$, E2:E3 ratio and S_R) fluorescence indices (FI and β:α index), molecular index (deoxyC6:C5 ratio, fVEG, C/V ratio and Ac:Al(V) ratio) and δ^{13}C-DOC. Statistical tests were based on models for comparison between years of sampling, peat porewater and pools and between seasons of sampling for peat porewater and pools. Significant differences were represented in bold. In the table, statistical test was abbreviating as K-W for Kusrall and Wallis test, WAOV for Welsh analyses of variances and AOV for analyses of variances and environments were abbreviated as P-P for peat porewater and Po for pools. There was no test to compare the effect of years on fluorescent indices considering all data came from samples of the same year of sampling periods.

Table SI.3. Synthesis of published DOC concentrations in peat porewater and pool in northern hemisphere peatlands

Reference	Peatland type	Location	Biome	Sampled environments	DOC concentrations (mg L^{-1})
Peat Porewater					
This study	Bog	Bouleau peatland (Québec, Canada)	Boreal	6 wells collecting porewater	18.0 ± 8.4
Arsenault et al., 2019	Bog	Grande Plée Bleue (Québec, Canada)	Temperate	10 wells collecting porewater	39.0 ± 9.1
Austnes et al., 2010	Bog	Afon Ddu (Wales)	Temperate	*Sphagnum* porewater (Sph) and 3 porewater samples: one in micro rhizons (MR), one from a lysimeter at 5cm (ZT5) below surface and one from a lysimeter at 10cm bellow surface (ZT10)	Sph : 27-55 MR : 25.5-32 ZT5 : 21.5-33.5 ZT10 : 27-38
Beer and Blodau, 2007	Bog	Mer Bleu Peatland (Ontario, Canada)	Temperate	A multi-level piezometer collecting water from 35 to 165 cm at 10 cm interval and one well collecting peat porewater	from 10 to 50 mg L-1 and concentrations always higher to 20 mg L-1 in first to 100 cm of peat column
Deshpande et al., 2016	Bog	Sasapimakwananisikw River Valley (Québec, Canada)	Subarctic	Concentration measured from peat solubilized in Milli-Q water from 3 depths at every 2 cores sampled in active layer of peat	13.9-28.8
Gandois et al., 2019	Thermokarst bogs	Igarka region (Siberia, Russia)	Subarctic	Water collected by wells in the active layer	Small bogs: 44.1 ± 10.1 Large bogs: 16.7 ± 1.2
Raudina et al., 2017	5 bogs along a longitudinal gradient	Western Siberia Lowlands (Russia)	Artic	Porewater collected in histosols with tension lysimeter	33.7-97.9

Tipping et al., 2010	*Sphagnum* peat bog	Cottage Hill Sike (North Pennies, England)	Temperate	Porewater collected with tension lysimeter at 10 and 50 cm depth	20.6 ± 4.1
Pools					
This study	Bog	Bouleau Peatland (Québec, Canada)	Boreal	9 pools	10.5 ± 4.1
Arsenault et al., 2018	Bog	Grande Plée Bleue (Québec, Canada)	Temperate	62 pools	25.8 ± 6.2
Arsenault et al., 2019	Bog	Grande Plée Bleue (Québec, Canada)	Temperate	5 pools	18.3 ± 4.7
Deshpande et al., 2016	Bog	Sasapimakwananisikw River Valley (Québec, Canada)	Subarctic	3 thermokarst lakes	8.5-11
Laurion and Mladenov, 2013	Bog	Sirmilik National Park on Bylot Island (Nunavut, Canada)	Arctic	2 pool types: 1. ponds on top of low-centred polygons 2. water from degraded ice wedges	8.5-13.1
Laurion et al., 2021	Bog	Sirmilik National Park on Bylot Island (Nunavut, Canada)	Arctic	11 pools from low centred polygons	9.2
Peura et al., 2016	Palsa bog	Whapmagoostui-Kuujjuarapik (Québec, Canada)	Arctic	12 thaw pools (development stage: emerging, developing, and mature pools)	25.8 ± 10.1
Turner et al., 2016	Bog	3 regions: Flow Country (north Scotland), Silver Flowe (southwest Scotland), Northern Ireland	Temperate	66 pools in 6 peatlands	Flow Country: 13.58 ± 4.58 Silver Flowe: 6.7 ± 2.0 Northern Ireland: 14.5 ± 3.1
