Supplementary material

Table S1. Additional information on location and time of beach transects. The coordinates provided here show the exact location of the upper end of the swash zone. Transects extended 150-220 m offshore as shown in Fig. 2 in the main text.

| Location | Latitude | Longitude | Sampling time | Low tide | High tide |
|---------------|------------|------------|---------------|--------------------|--------------------|
| Clifton South | -42.992299 | 147.524931 | 11:30-1:30 | 0.48 m at 11:02 am | 1.08 m at 17:58 pm |
| Goats | -43.022267 | 147.500408 | 10:24-11:40 | 0.9 m at 13:26 pm | 1.02 m at 9:40 am |
| Clifton North | -42.987078 | 147.54194 | 10:16:-11:23 | 0.51 m at 9:37 am | 1.15 m at 16:36 pm |
| Wedge | -43.033122 | 147.475549 | 10:39-11:50 | 0.55 m at 6:56 am | 1.19 m at 13:57 pm |

Table S2. Additional information on beach sand and alkalinity source minerals used for the three laboratory experiments. Sampling coordinates for olivine and steel slag are approximate as it was not recorded where exactly in the quarry/deposition site rocks were collected. The range provided for carbonate weights is based on the two most extreme assumptions that all carbonate in beach sand is MgCO₃ (lower value) or CaCO₃ (upper value).

| Mineral | Latitude | Longitude | PIC/POC (mol:mol) | Water content (%) | Carbonate weight (%) |
|------------|------------|-----------|-------------------|-------------------|----------------------|
| Beach 1 | -42.992872 | 147.52372 | 1.02 | 5.9 | 2.7 - 3.3 |
| Beach 2 | -42.991129 | 147.52686 | 2.97 | 13.5 | 11.9 - 14.2 |
| Beach 3 | -42.989084 | 147.53179 | 5.21 | 10.9 | 12.8 - 15.2 |
| Beach 4 | -42.988162 | 147.53538 | 16.25 | 4.3 | 24.4 - 28.9 |
| Beach 5 | -42.992724 | 147.52394 | 1.65 | 14.6 | 4.9 - 5.9 |
| Olivine | -38.006 | 142.793 | - | - | - |
| Steel slag | -33.01 | 137.589 | - | - | - |

29 **Figure S1.** Locations of the beach transects and beach sand sampling in Tasmania. (A) Map
 30 of Tasmania with (B) enlarged map of the Southarm region south of Hobart. The needles
 31 show locations with names of the beach transects shown in Fig. 2 of the main text. The pink
 32 line along Clifton Beach shows the part of the beach from where sand samples (Sand 1-5)
 33 were collected for incubation experiments. The camera symbol illustrates the position from
 34 where the picture shown in panel (C) was taken. (D) One of the holes that was dug to sample
 35 seawater just above the swash zone, i.e. the first sample location along the transects from the
 36 beach towards 150-200 m offshore. The two screenshots of the maps were reproduced with
 37 the permission of the Environment Heritage and Land Division, Department of Natural
 38 Resources and Environment Tasmania, © State of Tasmania.
