

## Supplementary information

### 1 – Age model for the Shungura Formation

This paper uses a revised age model for the Shungura Formation, interpolated based on the latest published absolute age data.

The interpolation was carried out on the R.4.1.3 software, with the function splinefun (“stats” package, R Core Team, 2022)

5 by implementing the data of the maximum cumulative thickness of sediments (Heinzelin and Haesarts, 1983) and the absolute ages known for some units of the Shungura Formation. For the Basal Member and the top of Member L, ages are interpolated by linear fit based on sedimentation rate. this age model is likely to evolve with the addition of new dating data.

**Table S1. The age model for the Shungura Formation, for each stratigraphic unit as a function of the maximal cumulative thickness of units. References for known absolute age are also provided in bold. Abbreviations: Magn, magnetochronology; Rad, radiochronology. Ages are given for the top of the stratigraphic units.**

Member	Unit	Maximal cumulative thickness	Interpolated age	Dating method	References
